Notice of the Provincial Development and Reform Commission and the Provincial Department of Ecology and Environment on the issuance of the "14th Five-Year Plan for Addressing Climate Change in Zhejiang Province"

Release date: 2021-06-21 12:09 Information source: Provincial Development and Reform Commission Views: 1457

Relevant provincial-level units, development and reform commissions (bureaus), and ecological environment bureaus (branches) of all cities, counties (cities, and districts):

The "14th Five-Year Plan for Zhejiang Province to Respond to Climate Change" is now issued to you. Please organize and implement it conscientiously in light of the actual situation.

Zhejiang Provincial Development and Reform Commission Zhejiang Provincial Department of Ecology and Environment

May 31, 2021

Zhejiang Province's 14th Five-Year Plan for Addressing Climate Change

The trend of global warming is intensifying, and the human living environment is facing severe challenges. China has always been an important promoter and practitioner of the global climate governance process.

We will unswervingly implement the national strategy of actively responding to climate change, take the path of green and low-carbon development, and promote the building of a community with a shared future for mankind.

The Secretary-General made a solemn commitment to the international community to "strive to achieve carbon peak before 2030 and carbon neutrality before 2060", and clearly incorporated carbon peak and carbon neutrality into ecological civilization.

The overall construction layout demonstrates climate ambition and responsibility as a major country.

In 2020, General Secretary Xi Jinping, during his inspection in Zhejiang, endowed our province with the mission of "striving to become an important window to fully demonstrate the superiority of the socialist system with Chinese characteristics in the new era".

The 14th Five-Year Plan period is a critical period for carbon peak and a period for the comprehensive green and low-carbon development of the economy and society.

In order to implement Xi Jinping's ecological civilization thought and the important expositions of the General Secretary on carbon peak and carbon neutrality, we should deeply practice the idea that green water and green mountains are gold.

This plan is formulated based on the concept of "mountains and silver mountains", actively promoting the modernization of climate governance system and governance capacity, and realizing high-quality green and low-carbon development in the province.

I. Current Situation and Situation

1. Climate characteristics and changing trends

Zhejiang is located in the southeastern coastal area of my country and has a typical subtropical monsoon climate zone with significant monsoons, distinct four seasons, moderate temperatures, sufficient sunlight, and abundant rainfall.

The air is moist and the natural conditions are relatively favorable. Against the backdrop of global warming, our province has been hit by typhoons, rainstorms, floods, extreme heat, droughts, cold waves, etc.

Meteorological disasters are showing new characteristics such as high frequency of occurrence and wide impact range.

The temperature rise trend is obvious. Since 1961, the average temperature has increased by 0.28°C every 10 years. Among them, the annual average temperature has increased significantly since the 1980s.

The rate is 0.47ÿ every 10 years, which is higher than the national average of 0.36ÿ during the same period. The number of low temperature days decreases at a rate of 3.3 days every 10 years.

The uneven seasonal distribution of precipitation has intensified. Since 1961, the average annual precipitation in our province has increased at a rate of 39.1 mm per decade.

The trend of uneven distribution has further expanded, and extreme meteorological disasters such as floods and droughts have occurred frequently, and their intensity and duration have continued to increase.

In the autumn of 2019 and the autumn and winter of 2020, the province experienced long-term and widespread drought, which had an adverse impact on water use and agricultural production for urban and rural residents.

The rate of sea level rise has accelerated. Since 1980, the sea level along the coast of our province has risen at a rate of 3.5 mm per year, which is higher than the national average during the same period. In the 21st century, the sea level in our province was generally at a historical high. In 2019, the sea level was 93 mm higher than the annual average, the second highest since 1980. As one of the hardest-hit areas by storm surges, rising sea levels have made storm surge disasters more severe, causing coastal erosion and seawater intrusion into underground freshwater layers, which have directly affected coastal residents. People's life.

2. Effectiveness of efforts to address climate change

Since the 13th Five-Year Plan, our province has been guided by the development concepts of innovation, coordination, greenness, openness and sharing, firmly implemented the national strategy of actively responding to climate change, and firmly adhered to the Adhere to the principle of giving equal importance to mitigation and adaptation to climate change, comprehensively deepen the adjustment of economic, industrial and energy structures and green and low-carbon development, and vigorously promote the response to climate change in all fields. positive progress and results.

The level of industrial digitalization has been steadily improving. The added value ratio of the three industries has been adjusted from 4.1:47.4:48.6 in 2015 to 3.3:40.9:55.8 in 2020. In 2017, the added value of the province's core digital economy industries reached 702 billion yuan, accounting for 10.9% of GDP, an increase of 3.2 percentage points from 2015. The added value of the "three new" economy, which is mainly characterized by the new model, accounted for 27% of GDP, an increase of 5.8 percentage points from 2015. The total output value of the energy-saving and environmental protection industry exceeded one trillion yuan. Among the above-scale industries in the province, the added value of strategic emerging industries, high-tech industries, equipment manufacturing, and high-tech manufacturing accounted for 33.1%, 59.6%, and 44.2% and 15.6%, respectively, up 7.5, 22.4, 7.4 and 4.9 percentage points from 2015. A total of 9,500 enterprises have been eliminated from obsolete and overcapacity industries. Many companies have rectified and upgraded the "low-scattered" block industries involving 155,400 enterprises (workshops).

The degree of energy cleanliness has been further improved. In 2019, the primary energy consumption structure of the province included coal, petroleum and its products, natural gas, non-fossil energy, and external Thermal power and other energy sources accounted for 45.3%, 16.8%, 8.0%, 19.8% and 10.1% of the total primary energy consumption in the province respectively. Compared with 2015, the proportion of coal decreased by 7.1%. percentage points, natural gas accounted for 3.1 percentage points, and non-fossil energy consumption accounted for 3.8 percentage points. In 2020, the installed capacity of clean energy power generation will be 52.9 million kilowatt-hours. Watts, accounting for 52.0% of the total installed capacity, an increase of 11.7 percentage points from 2015. The scale of photovoltaic power generation has grown rapidly, with various forms of development and application. The installed capacity is 15.17 million kilowatts, an increase of 827% over 2015, of which distributed photovoltaic installed capacity is 10.7 million kilowatts, and the installed capacity has ranked first in the country for many years. The province's energy consumption per 10,000 yuan of GDP is 0.37 tons of standard coal, and its energy efficiency level ranks among the top in the country.

Green buildings and transportation are developing rapidly. In 2020, the proportion of green buildings in urban areas in the province to newly built civil buildings will reach more than 97%, and renewable energy will account for 1.3% of the total construction area. The proportion of consumption in the construction field is 11%. In 2020, the number of new energy buses in the province reached 27,395, and the proportion of clean energy buses and taxis reached 80%. Hangzhou and Huzhou The main urban area has achieved full coverage of clean energy buses. Deeply implement the public transportation priority development strategy, advocate slow-moving transportation such as bicycles and walking, and online booking The province's public transport motorized travel share rate increased from 34.3% in 2016 to 36.7% in 2020. We will vigorously promote the construction of port shore power, and achieve full coverage of shore power facilities in the Beijing-Hangzhou Grand Canal, Huzhou and Jiaxing inland water service areas.

The ability to adapt to climate change is gradually enhanced. The construction of sponge cities continues to deepen, with 25% of the built-up areas in prefecture-level cities and 20% of the built-up areas in county-level cities reaching sponge cities. City construction requirements. Achieve full coverage of meteorological disaster prevention and mitigation standardization in towns (sub-districts), establish and improve meteorological disaster prevention, mitigation and relief coordination involving 28 departments such as emergency management During the 13th Five-Year Plan period, a total of 163 soil and water loss control projects were implemented, and the area of soil and water loss control reached 958 square kilometers. There are 310 forest protection areas, forest parks, scenic spots, wetland parks, geological parks, and marine special protection areas (marine parks). Control capabilities are constantly improving, the incidence and damage rates of forest fires are at historical lows, and the pine wood nematode epidemic has seen its first downward turning point for the first time in 30 years.

The work system for addressing climate change has basically taken shape. The province was the first in the country to issue the work responsibilities and work plans of the member units of the provincial joint conference on addressing climate change and energy conservation and emission reduction. Establish and implement a statistical reporting system for addressing climate change, establish a provincial, municipal and county-level comprehensive Actively participate in the construction of the national carbon market, build a Zhejiang Province climate change research and exchange platform, and establish a complete Improve the corporate carbon emission monitoring, reporting and verification system. Actively create national and provincial low-carbon pilot projects, with 11 national low-carbon pilot projects and 37 provincial low-carbon pilot projects. points, forming a multi-level low-carbon pilot system covering cities, towns, parks, communities, and enterprises, and holding the Zhejiang Province Low-Carbon Product Technology Exhibition and the "Belt and Road" cooperation project We will participate in international cooperation activities such as the China-Europe Economic Cooperation Forum, South-South Cooperation on Climate Change, and participate in the Conference of the Parties to the United Nations Framework Convention on Climate Change to promote the low-carbon development of Zhejiang Province. Verification and mode.

(III) Development opportunities

The new situation of cooperative and win-win climate governance brings new opportunities for global multilateral cooperation. The world is undergoing a major change unseen in a century, and global climate governance remains a key task for cohesion. We will continue to strengthen cooperation and jointly promote the multilateral cooperation process on global climate change and implement the Paris Agreement. To achieve win-win results and common progress will become the new normal for climate governance in all countries. General Secretary Xi Jinping announced at the general debate of the 75th United Nations General Assembly that my country's We will strive to peak carbon emissions by 2030, achieve carbon neutrality by 2060, and further increase our national voluntary contribution targets at the Climate Ambition Summit. The new journey of global response to climate change has been fully launched, and China China has become an important participant, contributor and leader in the global climate governance process. The "Chinese solution" and "Chinese wisdom" will make contributions to all countries in jointly addressing global challenges. Active contribution.

Machine Translated by Google

The new climate governance system, where everyone does their best, brings new opportunities for my country to build a new development pattern. The 14th Five-Year Plan is at the historical intersection of the two centenary goals. This is the first five-year period to build a moderately prosperous society in all respects and move towards the goal of a beautiful China. Since the mid-20th century, China's warming rate has been significantly higher than the global level during the same period. Climate change poses severe challenges to the economy, ecology, energy, and food security, and the level of climate risk is increasing. Strengthening climate governance is an important way to ensure national security and promote sustainable development. It is an inherent requirement for sustainable development and a systematic, overall and long-term task. Comprehensively deepen the response to climate change, high-quality economic development, and high-quality ecological environment. Comprehensively accelerate the green and low-carbon transformation of energy, industry, transportation, construction, agriculture and other fields, and comprehensively promote the autonomous development of local governments, departments and industries. Innovative low-carbon actions will become an important measure to thoroughly implement Xi Jinping's thoughts on ecological civilization and implement the new development concept.

The new climate governance goals of carbon peak and carbon neutrality have brought new opportunities for Zhejiang to build an "important window". Focus on promoting green and low-carbon development and building modern climate governance The system should become a systematic breakthrough and landmark achievement of our province's efforts to build an "important window" to showcase the harmonious coexistence of man and nature and the highly developed ecological civilization, and is an important step in creating a beautiful The specific practice of the pilot demonstration zone in China. Taking the carbon peak and carbon neutrality as an opportunity, we will accelerate the construction of a green, low-carbon and circular economic system, and accelerate the formation of a green, low-carbon Zhejiang is an important birthplace of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, a green The birthplace and first place to practice the concept of "clear water and green mountains are gold and silver mountains" shoulders the important mission of "leading by example in ecological civilization construction". and the integrated pattern of the Yangtze River Delta, and truly be a practitioner, promoter and demonstrator of climate governance, with strong institutional implementation, effective mechanism innovation and orderly Actively implement and promote the "Window of Zhejiang" to better showcase "China's Governance".

4. Challenges

From the perspective of development stage, our province is still in a stage of rapid economic and social development, and urbanization and industrialization have not yet been completed. There is still a big gap between the indicators of per capita income and those of developed countries. In the future, with the development of economy, population growth, urbanization and improvement of people's quality of life, the total energy Demand will continue to grow, and carbon emissions will also increase. In recent years, although carbon emission intensity has shown a downward trend, it is still comparable to developed countries such as South Korea, Japan, the European Union, and the United States. Compared with other economies, it is still generally high.

From the perspective of emission structure, carbon emissions in our province are concentrated in six major areas, namely energy, industry, construction, transportation, agriculture and residents' lives, among which energy and industry are dominant. In terms of energy structure, fossil energy, especially coal, still accounts for a relatively high proportion. In 2019, fossil energy consumption in our province accounted for 80.2%, of which coal accounted for 45.3%, resulting in carbon emissions of 1.92 tons per ton of standard coal consumed in our province. In terms of industrial structure, the main reasons are the high carbonization of industrial structure, such as oil processing, building materials, The seven major "high-carbon industries" including paper, chemicals, chemical fibers, steel, and textiles account for as much as 70% of carbon emissions and only create 30% of added value.

From the perspective of work basis, responding to climate change is a strategic, overall and systematic task. The province has made great efforts to achieve the goals of medium- and long-term low-carbon development, carbon peak and carbon neutrality. There is a lack of strategic planning guidance for implementation. Various low-carbon related policies need to be formulated and improved. The coordination mechanism between departments needs to be established and improved. The digital transformation of climate governance needs to be accelerated. The construction of various "zero-carbon" or low-carbon pilot projects still needs to be vigorously promoted.

II. General requirements

1. Guiding ideology

Adhere to the guidance of Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, thoroughly implement the spirit of the 19th CPC National Congress and the Second, Third, Fourth and Fifth Plenary Sessions of the 19th CPC Central Committee, God, fully implement Xi Jinping's ecological civilization thought, deeply practice the concept that green waters and green mountains are gold and silver mountains, grasp the new development stage, implement the new development concept, and build a new development pattern, adhere to a systematic concept, incorporate carbon peak and carbon neutrality into the overall layout of ecological civilization construction, promote green and low-carbon development of industry and energy as the key, control Control greenhouse gas emissions, focus on improving infrastructure resilience and ecosystem stability, enhance the ability to adapt to climate change, promote coordinated and sound pollution reduction and carbon reduction We will focus on improving our ability to address climate change, promote systemic changes in the economy and society, and take the lead in achieving a comprehensive green transformation of economic and social development. We will strive to build a modern society where people and nature coexist harmoniously, and strive to build an "important window" for our province, strive to become a pioneer province in socialist modernization, and build a beautiful China. The demonstration area provides solid support.

2. Basic principles

——Adhere to a systematic concept and make overall progress. Guided by the goals of carbon peak and carbon neutrality, we will strengthen overall planning, strategic layout, and overall promotion, and deal with We will improve the relationship between development and emission reduction, overall and local, short-term and medium- and long-term, accelerate the transformation of industrial structure and energy structure, and coordinate the promotion of key areas and key regions. Work on climate change.

——Adhere to the guidance of science and technology and digital empowerment. Strengthen scientific and technological innovation support for addressing climate change, accelerate the research and development and application of green and low-carbon technologies, and develop various Climate adaptive technology. Use digital means to promote the work of addressing climate change, strengthen the application of big data in addressing climate change, and improve the level of digital smart governance.

——Adhere to institutional innovation and take the lead in trial implementation. Actively explore institutional reforms and innovations in response to climate change that are in line with provincial conditions and have their own characteristics, and give full play to the market mechanism. We should give full play to the initiative and creativity of grassroots units, innovate and deepen the creation of pilot projects to address climate change, and explore new paths for green and low-carbon development.

——Adhere to government leadership and social participation. Give full play to the government's leading role in addressing climate change and strengthen the promotion of mitigation and adaptation work. Actively guide all sectors of society to participate in addressing climate change, give full play to the main role of enterprises and the public in mitigation work, and tap the potential for adaptation work.

(III) Target indicators

1. Overall Objectives

Machine Translated by Google

By 2025, a climate change response system that is coordinated with economic and social development, adapted to ecological civilization construction, and integrated with ecological environmental protection will be initially formed.

In the new situation, the foundation for carbon peak has been further consolidated, the ability to adapt to climate change has been effectively improved, and the ability to govern climate change has been effectively enhanced.

——The total amount and intensity of carbon emissions are effectively controlled. The level of low-carbon development has been significantly improved, low-carbon production and lifestyle have been basically formed, and the ecosystem carbon sink has become obvious.

By 2025, the proportion of non-fossil energy in primary energy consumption will reach 24%, and the carbon dioxide emissions per unit of regional GDP will be reduced to meet the national target.

The total amount of emissions is effectively controlled.

——The ability to adapt to climate change has been effectively improved. The ability of infrastructure to adapt to climate change has been significantly enhanced, the flood control and disaster reduction system for rivers, lakes and reservoirs has been further improved, and agriculture

The ability to adapt to climate change has been continuously improved, the flood and typhoon prevention capabilities of coastal areas have been significantly enhanced, the stability of the ecosystem has been further improved, and the early warning and response capabilities for climate disasters have been

Significantly enhanced.

—— Climate governance capacity has been effectively enhanced. The institutional system for addressing climate change has been further improved, pollution reduction and carbon reduction have been coordinated, and the level of scientific and technological innovation has been significantly enhanced.

Digital empowerment has been deepened, market mechanisms have been effectively established, and the talent team has been further expanded.

——The demonstration and pilot system is sound and complete. The low-carbon development demonstration and pilot projects are fully promoted, the climate change adaptation demonstration and pilot projects are actively promoted, and supporting policies and evaluation indicators are improved.

The system has been gradually improved, and a number of green and low-carbon parks and "zero-carbon" demonstration pilot projects with typical demonstration significance have been built.

——Low-carbon action has become a new fashion. Green production, green consumption, and green procurement are being carried out in an all-round way, and the whole nation is practicing the basic concept of simple, moderate, green, and low-carbon life.

This formation.

By 2035, carbon emissions will steadily decrease after peaking, green production and lifestyles will be widely formed, and the ability to adapt to climate change will be significantly enhanced. In order to achieve carbon emissions before 2060,

Neutralization lays a solid foundation.

2. Specific indicators

During the 14th Five-Year Plan period, a total of 14 key indicators for addressing climate change were set, including comprehensive indicators, indicators in various fields of climate change mitigation and adaptation, and demonstration and pilot projects.

Point construction indicators.

Table 1 Index system for responding to climate change in Zhejiang Province

Category No	Specific indicators	Unit 2020-2025			index nature
Comprehensive Index Standard	1 CO2 emissions per unit of GDP Low	% -		State issued index	Constraints
Slow down Climate Change	2 Energy consumption per unit of GDP reduced by % -			State issued index	Constraints
	3 Non-fossil energy as a percentage of primary energy consumption	19.8%*		24	Constraints
	4. Reduced energy consumption per unit of industrial added value	% -		16	Anticipation
	5% of newly built green buildings with two stars or above -			30	Anticipation
	6 Add or update taxis and buses in the main urban area Proportion of new energy vehicles delivered	% -		ÿ80	Anticipation
	7 Forest stock	Yili Square meter	3.75	ÿ4.45	Constraints
	8 Wetland reserves/wetland protection rate	1665/52 1665/52 mu/%		above binding	
Adapt to the atmosphere Climate Change	9. Mainland natural coastline retention rate	% -		ÿ35	Constraints
	10 Achieve the goal of sponge city construction Area ratio	% -		ÿ55 cities; Other counties ÿ 25	Anticipation
	11. A total of 10,000 mu of high-standard farmland has been newly built or upgraded.			300	Anticipation
	12 Meteorological disaster losses accounted for the GDP of the region Average ratio	% -		ÿ2	Anticipation
Demonstration test Point Construction	13 "Zero Carbon" Demonstration County (City, District)/"Zero "Zero Carbon" Demonstration Township (Street)/"Zero Carbon" Demonstration Number of village (community) construction	indivual-		10/100/1000 Anticipation	
	14 Number of green and low-carbon parks built	indivual-		50	Anticipation

Note: Data marked with "*" are from 2019.

III. Focus on controlling greenhouse gas emissions

Promote greenhouse gas emission reduction in key areas such as energy, industry, construction, and transportation, effectively control non-CO2 greenhouse gas emissions, and increase ecosystem carbon

We will form a low-carbon production and lifestyle and promote the comprehensive low-carbon transformation of the economic system.

1. Promoting high-quality and low-carbon development of the economic system

Machine Translated by Google
29/03/2024, 01:48

Promote the digital transformation of the economic system. Deeply implement the "No. 1 Project 2.0" of the digital economy, highlight the leading, leveraging and enabling role of digitalization, and accelerate the development of the digital economy. Implement the five-year digital economy doubling plan, vigorously build a national digital economy innovation development pilot zone, build a digital technology innovation center, and strengthen We will quickly build a source of digital transformation. We will strengthen energy conservation in the construction of new infrastructure in the digital economy field, and improve the energy efficiency of information infrastructure such as data centers and new communications. By 2025, the added value of core industries in the digital economy will account for about 15% of the regional GDP.

Develop strategic emerging industries and future industries. Seize the development opportunities of emerging industries and accelerate the cultivation of life and health, new materials, new energy, smart cars, aviation Strategic emerging industries such as aerospace have become new pillar industries, and carbon neutrality-related industries such as energy storage and hydrogen energy have been actively deployed. Combined with the construction of the "10,000 mu and 100 billion" platform, we will focus on the strategy In the key sub-sectors of strategic emerging industries, a number of strategic emerging industry clusters with strong competitiveness in the country have been cultivated. We will accelerate the construction of future industry pilot zones, focusing on future industries such as engineering, third-generation semiconductors, brain-like chips, flexible electronics, cutting-edge new materials, and quantum information.

Promote the quality and efficiency of modern service industry. Accelerate the development of modern service industry, promote the high-end and professional development of productive service industry, focus on the development of software and information Services, technology services, modern logistics, financial services, creative design, supply chain management and other productive services. Promote the development of life services towards refined, high-quality Development, relying on the construction of the four poetry roads and cultural belts, vigorously develop the cultural and creative industries and tourism industries. By 2025, the added value of the province's service industry will account for 1.5% of the regional GDP. To more than 60%.

Strengthen the energy-saving and environmental protection industry. Increase energy-saving and environmental protection technology and equipment in the fields of air pollution control, water pollution control, solid waste treatment, soil pollution remediation, etc. Promote energy-saving and environmentally friendly products, strengthen innovation in energy-saving and environmentally friendly technologies, and further promote the development of circular economy. We will implement the extended producer responsibility system, improve the recycling network system, standardize cascade utilization, recycling and disassembly, resource utilization and harmless disposal. Disposal, strengthen the market players of resource recycling and utilization, and improve resource utilization efficiency. Vigorously develop third-party services for energy conservation and environmental protection, introduce and cultivate a number of key energy-saving Environmental protection service enterprises will promote the development of energy-saving and environmental protection services. By 2025, the total output value of the energy-saving and environmental protection industry will reach 1.5 trillion yuan.

Create a number of important low-carbon development platforms. Focus on developing a modern industrial system, highlight low-carbon practices, and build the Zhoushan Archipelago New Area and provincial new The district will focus on promoting the construction of Hangzhou Qiantang New District, Ningbo Qianwan New District, Huzhou Nantaihu New District, etc., to create an important carrier for the low-carbon development of the industry. Ningbo Yongjiang, G60 (Zhejiang section), Wenzhou Huandaluoshan, Zhejiang and other science and technology innovation corridors are being built to create an important carrier for the development of low-carbon technologies and the promotion and application of low-carbon products. body.

2. Promoting low-carbon energy transformation

Vigorously develop non-fossil energy. Deepen the creation of a national clean energy demonstration province and vigorously develop non-fossil energy. Safely develop nuclear power and build the Sanmao Nuclear Power Plant. In the next phase, we will strive to complete the second phase of Sanmen Nuclear Power Plant. We will rationally develop hydropower and accelerate the construction of pumped storage projects such as Changlongshan, Ninghai, and Jinyun. By 2025, we will add more pumped storage Energy storage capacity is 3.4 million kilowatts. Vigorously develop photovoltaic power generation, continue to promote the application of distributed photovoltaic power generation, and actively develop building-integrated photovoltaic power generation systems. Develop an eco-friendly "photovoltaic + agriculture and fishery" model. Develop wind power in an orderly manner, focus on promoting the construction of offshore wind power projects, and create a "million-kilowatt offshore wind power application base + offshore The new development model of "foreign ranch" is to moderately develop onshore distributed wind power. Expand the external power supply through multiple channels, promote the construction of cross-regional power channels, and build the Baihetan Hydropower Station. To Zhejiang UHV DC project. Develop biomass (including garbage) power generation according to local conditions and actively explore new models for comprehensive development and utilization of ocean energy. Accelerate the construction of energy storage infrastructure By 2025, the installed capacity of non-fossil energy power generation will reach more than 63 million kilowatts.

Use fossil energy in a clean and efficient manner. Strengthen the total control of coal consumption, establish a deep "coal control" mechanism, and formulate work plans for reducing and replacing coal consumption in different regions and industries. Actively promote the low-carbon utilization of coal, encourage the use of clean coal and high calorific value coal, improve the efficiency of coal-fired power generation, reduce the self-use rate of power plants and carbon emissions, and achieve thermal The average standard coal consumption for power generation has been declining. We will continue to implement coal-to-gas projects, increase natural gas coverage and gasification rates, actively promote the development of natural gas distributed energy, and expand Large-scale natural gas utilization. Steadily promote the low-carbon utilization of oil products and promote the use of biomass fuels.

Focus on promoting energy efficiency improvement. Carry out national pilot projects to lead energy efficiency innovation, revise the technical guidelines for industrial energy efficiency, and establish energy efficiency access standards for key industries and projects. Improve the "dual control" system of total energy consumption and intensity, and establish a linkage mechanism between energy "dual control" and regional planning, industrial planning, and preliminary planning of major projects. For high-energy-consuming projects, strictly implement the system of reducing production capacity and energy consumption in high-energy-consuming industries. By 2025, the energy consumption per unit of industrial added value (excluding major petrochemical projects) The total output of energy resources will drop by more than 16% compared with 2020. Promote the allocation of energy resources to major platforms, key industries and key projects, and give priority to supporting high-quality development of industrial chain and supply chain to make up for shortcomings. Major projects, improve the regional energy assessment + industry energy efficiency technical standard mechanism, strengthen the cultivation of energy-saving service industry, carry out energy resource measurement services, improve energy resource market Improve the level of market configuration and institutional construction. Study and formulate the "Zhejiang Province Industrial Energy Efficiency Leader Special Action". Implement the Energy Efficiency Leader Plan and establish an energy-saving incentive guidance mechanism. system, set industry benchmarks, and promote key enterprises to carry out energy efficiency benchmarking.

3. Accelerating the low-carbon transformation of industry

Strictly control the blind development of high-energy-consuming and high-emission projects. Control the expansion of production capacity in high-energy-consuming and high-emission industries, and classify the "two high" projects under construction, planned to be built, and in stock. All completed "two high" projects will be included in the online monitoring system of key energy-consuming units to strengthen regular supervision. We will explore the implementation of carbon intensity classification management for key industries, establish an average advanced carbon emission benchmarking mechanism, and publish the average carbon emission industries and major products of key carbon emission industries. Carbon emission intensity should be improved, and enterprises with emissions below the average level should be guided to meet the emission standards. The entry threshold for new projects should be raised, and large energy-intensive projects should be introduced with caution.

It will be constructed in accordance with the most advanced energy efficiency standards and follow-up energy-saving technological improvements will be strengthened. By 2025, carbon dioxide emissions per unit of industrial added value will be significantly reduced.

The total amount tends to be stable.

Promote low-carbon transformation of traditional industries. Continue to promote energy conservation and efficiency improvement in the industrial sector, promote green and low-carbon upgrading of traditional industries, and strictly implement the Energy Conservation Law, Environmental Protection Law, etc.

We will follow the Environmental Protection Law, Product Quality Law, Work Safety Law and the Guidance Catalogue for Industrial Structure Adjustment, and promote the orderly withdrawal of obsolete production capacity in accordance with laws and regulations.

By 2025, 50 green and low-carbon parks and 500 green and low-carbon factories will be built. In conjunction with the construction of the "factory of the future", digital technology will be used to

Applied to industrial transformation and upgrading, in-depth promotion of green manufacturing, digital design, intelligent technology transformation, "enterprise cloud", digital management, "Internet +" new model, etc.

In the application of industry, we will accelerate the establishment of a new model of fast and flexible production, and accelerate the improvement of the industry's low-carbon and high-efficiency development level. We will fully promote green manufacturing, use technology and information technology to

Informatization means to promote low-carbon manufacturing.

Promote the green and circular development of industry. Implement the upgraded version of the circular economy "991" action plan, implement green upgrading and transformation of industrial parks, and strive to enhance the demonstration of resource recycling.

Improve the level of urban (base) construction. Promote integrated energy and resource solutions for parks and promote circular construction of new parks. Guide the green and circular development of industry.

Accelerate the circular transformation of industries such as electricity, building materials, and petrochemicals. By 2025, the output rate of major resources will increase by 15%.

Enterprises in key industries such as textile industry, printing and dyeing should implement clean production transformation to reduce the generation of waste gas, wastewater and solid waste from the source.

4. Strengthen low-carbon management throughout the construction process

Fully implement green design for new buildings. Further increase the promotion of green and low-carbon buildings, fully implement green building standards, and vigorously promote new types such as prefabricated buildings.

construction methods, expand the application scope of building energy-saving technologies and green building materials, promote the integrated application of renewable energy buildings, and increase the consumption of renewable energy in the construction field.

By 2025, all new urban buildings will be covered by green buildings, the proportion of two-star and above green buildings will be further increased, and the office buildings of state organs and

Other public buildings invested by the government or mainly by the government, built according to the mandatory standards of two-star green buildings and above, and prefabricated buildings in new urban buildings

The proportion reached 35%.

We will focus on promoting energy-saving renovation of existing buildings. We will focus on large public buildings and office buildings, and combine future community construction, renovation of old residential areas, and beautification.

Licheng Town construction and other work, carry out energy-saving renovations such as external wall insulation and ground source heat pump application, encourage photovoltaic building integration + energy storage, centralized cooling and heating energy stations, and vertical

Greening will be used first in future communities, and we will strive to complete energy-saving renovation of existing public buildings with an area of 5 million square meters during the 14th Five-Year Plan period.

Strengthen low-carbon management in the construction sector. Implement building electrification projects, promote efficient electrification application technologies and equipment, and improve the level of building electrification.

Promote the application of renewable energy, distributed energy, green building materials, etc. in the construction field. Promote energy-saving and low-carbon management of buildings, and gradually include public buildings in the scope of carbon verification.

Promote contract energy management, promote energy consumption statistics, energy audits and energy efficiency publicity for public buildings, and strengthen low-carbon operation of public buildings such as hotels, office buildings and shopping malls.

Operation and management, and research and formulate regulations on energy-saving and low-carbon management of buildings.

5. Building a low-carbon transportation system

Accelerate the formation of a green, low-carbon, modern integrated transportation system. Deepen the construction of a high-level transportation power province, build a modern integrated transportation hub, and develop smart transportation.

Promote the interconnection of transportation infrastructure in the Yangtze River Delta and build a Yangtze River Delta on rails. Accelerate the construction of intercity railway networks in urban areas and commuter railway networks in the Greater Bay Area, and promote

Urban (suburban) railways will be extended to the surrounding areas. The urban rail transit network will be intensified to effectively connect various functional groups and hub nodes.

Construction of cycling and leisure greenways such as Tangjiang River, along Oujiang River and along the coast.

Promote the adjustment of transportation structure. Fully implement the public transportation priority strategy, actively promote the integrated development of public transportation in the Yangtze River Delta, and accelerate the development of the provincial cities and the Yangtze River Delta.

The QR code for urban rail transit in the Jiao area and the urban transportation card are interconnected. By 2025, the share of motorized public transportation in the province will reach 40%.

The transport capacity structure will be improved by combining the construction of major channels, increasing the proportion of railway freight and expanding the advantages of green water transport.

We will carry out the demonstration project of "transferring road traffic to water traffic" for bulk cargo. We will develop low-carbon logistics and build a green urban logistics system. We will accelerate the elimination and replacement of old high-emission vehicles and further strengthen the

Release ship control.

Optimize the energy structure of transportation. Promote the use of new energy or clean energy vehicles, implement new energy actions for public vehicles and private cars, and encourage new

The use of new energy or clean energy vehicles in public transportation, taxis and work vehicles will be accelerated to achieve 100% new energy for newly purchased official vehicles, and the use of new energy or clean energy vehicles in social vehicles will be increased.

Energy ratio. Promote the use of new energy or clean energy such as electricity and natural gas. Increase the construction of charging piles. By 2025, the province will have built public charging

More than 80,000 charging piles (including more than 50,000 intelligent public charging piles) and more than 350,000 private charging piles. Accelerate the research and promotion of hydrogen fuel cell vehicles, intelligent network, etc.

Technology. Apply information technology such as the city brain to improve the level of intelligent transportation organization. Gradually expand the scope of carbon verification for transportation companies and strengthen energy consumption monitoring and statistics.

6. Practicing a low-carbon lifestyle

Increase the supply of green and low-carbon products. Guide and support enterprises to increase investment in the research and development, design and manufacturing of green and low-carbon products, and encourage large supermarkets to give priority to the introduction of green

green and low-carbon products, increase the effective supply of green and low-carbon products and services, and further strengthen the national key energy-saving and low-carbon technology promotion catalogue, energy conservation and emission reduction and low-carbon technology

Strengthen the promotion of the list of achievements transformation and promotion, and strengthen the implementation of the application. Promote the application of green packaging and new energy-saving and environmentally friendly materials, and promote the reduction and reuse of packaging products.

Guide enterprises to carry out green (low-carbon) product certification, eliminate high-energy-consuming products and technologies, and support enterprises in the province to achieve energy-saving

We can certify and label low-carbon products and explore the development of carbon labels.

Machine Translated by Google
29/03/2024, 01:48

Promote green procurement. Strictly implement the government's priority procurement and mandatory procurement system for energy-saving and environmentally friendly products, and further increase the proportion of recycled products and remanufactured products in government procurement. The proportion of manufactured products should be increased, and energy-saving and water-saving energy-efficiency and water-efficiency label catalog products should be prioritized, and the number of low-carbon products should be increased in the government procurement cloud platform commodity catalog. Further improve the government's procurement requirements for low-carbon products, increase the government's procurement proportion requirements for low-carbon products, and expand the scale of government green procurement.

Advocate low-carbon life. Promote energy-saving consumption and green and low-carbon consumption concepts for all people, incorporate green and low-carbon concepts into the education system, and carry out low-carbon campus construction. Education drives the whole society to practice green and low-carbon development. Taking advantage of the digital economy and the Internet in our province, we will explore a carbon credit system and promote the practice of green and low-carbon concepts. Implement the "Clean Plate Campaign" to encourage people to order food in moderation, simplify official receptions, and curb food waste. Promote green and low-carbon travel methods, and encourage people to walk, ride bicycles, Public transportation, carpooling and other low-carbon modes of travel. By 2025, the proportion of green travel in the central urban areas of large and medium-sized cities will reach 80%. Encourage residents to buy and use green and low-carbon products. We should strengthen the promotion of energy-efficiency and water-efficiency labels and guide the public to purchase energy-saving and water-saving products. We should advocate low-carbon lifestyles such as water-saving, electricity-saving and solar-saving, and strengthen the promotion of tiered water and electricity prices. The use of prices and gas prices can guide residents to consciously reduce energy and resource waste. Comprehensively and deeply promote garbage classification and recycling, and encourage the use of "Internet +" and other forms of waste recycling. Item trading can further reduce the use of disposable consumer goods.

7. Controlling non-CO2 greenhouse gas emissions

Control non-CO2 greenhouse gas emissions in industrial production processes. Strengthen the control of greenhouse gas emissions in industrial production processes through process technology improvements and end-of-pipe treatment. Reduce greenhouse gas emissions from industrial production processes through measures such as reducing greenhouse gas emissions from greenhouse gases such as hydrofluorocarbons. Actively promote the use of hydrogen with low warming potential. The production and use of fluorocarbon refrigerant substitutes will continue to strengthen the control of nitrous oxide emissions in the nitric acid production process and actively promote the implementation of nitrous oxide terminal treatment technology. Technique.

Control methane and nitrous oxide emissions from agricultural activities. Continue to reduce the use of chemical fertilizers and pesticides and increase their efficiency, and accelerate the promotion of organic and environmentally friendly pesticide substitution, soil testing and formula fertilization, and new Apply fertilizers to reduce nitrous oxide emissions from farmland. Breed high-yield, low-emission varieties, improve water and fertilizer management, and control methane emissions. To achieve full collection, full utilization or full compliance of pollutants from livestock and poultry breeding; strictly implement the ecological animal husbandry development plan and the requirements of livestock and poultry restricted areas, adjust the livestock and poultry breeding The types, scale and total amount of animal husbandry should be matched with the regional layout of animal husbandry and the carrying capacity of resources and environment, and agriculture and animal husbandry should be combined to form a green development model integrating breeding and processing. By 2025, the application intensity of chemical fertilizers (pure fertilizer) will be reduced to 15 kg/mu.

Control methane and nitrous oxide emissions from waste treatment. Fight a long-term battle to consolidate and improve the ecological environment across the region, promote the construction of "zero-waste cities", and accelerate the realization of low-waste Carbonization treatment. Promote the classification and treatment of various types of solid waste such as domestic waste and industrial waste, strengthen the recycling of renewable resources, and explore the establishment of a charging system for the treatment of various types of solid waste. Reduce the amount of solid waste generated from the source, and by 2025, the recycling rate of domestic waste in the province will reach 70%. Accelerate the recycling of urban waste in accordance with the principle of incineration as the main method and landfill as the supplementary method. Actively promote the construction of domestic waste incineration plants, promote the ecological restoration of domestic waste landfills, and accelerate the realization of basic coverage of domestic waste incineration treatment capacity in cities above the county level. Use large-scale landfill gas recovery and utilization technologies such as methane power generation to reduce methane emissions from landfills. Rationally plan and layout resource recycling bases to achieve waste gas recycling. Increase the recycling of urban domestic sewage, gradually improve the level of rural domestic sewage treatment, and actively use recycled water. By 2025, The provincial recycled water utilization rate shall not be less than 20%. Research and promote wastewater treatment methane emission recovery and utilization technology suitable for the actual situation of our province, focusing on strengthening the papermaking, chemical, and food Recycling of methane emissions from wastewater treatment in industries such as pharmaceuticals.

8. Increasing ecosystem carbon sinks

Increase forestry carbon sinks. Deeply implement the action of adding one million mu of land to the greening area, continue to promote the greening and beautification of the land, and enhance the carbon sink capacity of the land greening system. We should fully tap the potential of the "six major forests" in the mountains, slopes, cities, villages, passages and coastal areas, and strive to improve the The quality and stability of forest ecosystems. We will comprehensively implement the precise improvement project for the quality of tens of millions of acres of forests, strengthen timber reserves, connect beautiful ecological corridors, and build precious and colorful green and healthy forests, improve forest quality and benefits, continue to promote the construction of carbon sink measurement and monitoring system, and comprehensively grasp the status, changes, distribution and potential of forest carbon sinks in the province. We will promote a new round of "one village, ten thousand trees" demonstration village construction and improve the quality of rural greening. We will accelerate the construction of urban forests, with forest cities (towns), garden cities (township) construction as a carrier, expand the scale of core forests in urban built-up areas, and increase the proportion of tree forests in public facility green spaces. By 2025, the province's forest coverage rate will reach To 61.5%, the forest quality has been significantly improved.

Increase carbon sinks in oceans, wetlands, and agriculture. Combine comprehensive management of blue bays and restoration of silver beach shores to enhance ocean carbon sink capacity. Promote healthy aquaculture. We should strengthen the protection and restoration of wetlands, adhere to the combination of natural restoration and artificial restoration, and accelerate the construction of marine ranches to improve the carbon sequestration capacity of marine fisheries. We will restore and comprehensively improve the natural wetlands that are concentrated, fragmented, and functionally degraded. We will promote the restoration of the Nanhongbeiliu wetland and gradually restore the ecological functions of the wetland. Enhance the carbon sequestration capacity of wetlands. Deeply tap the carbon sequestration potential of agriculture, and enhance the carbon sequestration capacity of agricultural ecosystems through measures such as improving agricultural technology and adjusting planting patterns.

Column 1 Key projects for ecosystem carbon sink construction

Exploration of marine and wetland carbon sink methodology. Carry out special research on marine and wetland carbon sink statistical accounting and monitoring methodology, and explore the establishment of marine assessment system for coastal ecosystems such as oceans, mangroves, salt marshes and seagrasses.

Marine and wetland carbon sink pilot projects. Using marine and wetland ecosystem carbon sinks as a carrier, we organized coastal cities (Ningbo, Wenzhou, Zhoushan,

Pilot construction is being carried out in Taizhou and the cities around Lake Taihu (Huzhou) to enhance the ability of marine and wetland ecosystems to cope with climate change.

Carbon neutral information platform construction. Relying on the existing forest, ocean, wetland and agricultural resources in our province, we will build a carbon neutral information platform to achieve

Carbon neutral digital management. Take Hangzhou and Lishui as pilot cities to carry out the pilot construction of carbon neutral information platform, summarize the pilot experience, and gradually expand

Machine Translated by Google

Expand carbon sink area, deeply improve carbon sink quality, strive to build an ecosystem carbon sink database, regularly check, update, and publish carbon sink related indicators
Standard data lays the foundation for carbon sink product trading in the province.

IV. Carry out carbon dioxide emissions peak action

Focusing on the national carbon peak and carbon neutrality goals, we will study and formulate an action plan for carbon dioxide emissions peak in Zhejiang Province, and actively carry out special projects in key areas and key industries to achieve peak emissions.

An action is taken to encourage qualified regions and industries to take the lead in reaching carbon emission peak.

1. Research and formulate an action plan for reaching the peak of carbon dioxide emissions

Study and formulate an action plan for reaching the peak of carbon dioxide emissions in the province, clarify the peak target, roadmap, and implementation path. Promote energy, industry, transportation, construction, and agriculture

Formulate special action plans for peaking the greenhouse gas emissions in the fields of industry, residents' lives, and technological innovation. Guide each prefecture-level city to formulate a city-level peaking action plan. Deepen the greenhouse gas emissions reduction work at the provincial, municipal, and county levels.

We will strengthen the compilation of the inventory and the application of inventory data to provide data support for the peak of carbon dioxide emissions in key areas and key industries across the province.

2. Promoting the peaking of carbon dioxide emissions in key regions

Promote qualified regions to reach carbon emission peak first. Promote various regions to achieve carbon dioxide emission peak in batches, and promote qualified low-carbon pilot cities and major cities to achieve carbon emission peak.

The Yangtze River Delta Ecological Green Integrated Development Demonstration Zone will be promoted to achieve carbon dioxide emissions peak before 2025.

Key industrial platforms are encouraged to promote carbon emission peak action. National economic and technological development zones, provincial development zones, "10,000 mu and 100 billion" platforms and other industrial platforms are encouraged to study

Formulate an action plan for the park to achieve the peak of carbon dioxide emissions, eliminate obsolete production capacity, "empty the cage and replace the bird", "per mu hero" reform, promote the application of renewable energy, etc.

Deepen the low-carbon development of industrial parks and encourage provincial green and low-carbon parks to take the lead in carrying out carbon dioxide emissions peak actions.

3. Promoting the peaking of carbon dioxide emissions from enterprises in key industries

Promote the peak action of key industries. Identify the key industries in the province that need to reach the peak of carbon dioxide emissions, and study and formulate plans for steel, building materials, petrochemicals, chemicals, papermaking, chemical fibers,

The action plan for reaching the peak of carbon dioxide emissions in seven high-carbon emission industries, including textiles, clearly defines the key tasks for reaching the peak, and strictly implements the national capacity reduction and replacement policy.

Materials, steel, papermaking and other industries will take the lead in achieving peak carbon dioxide emissions. Actively guide key industries to develop low-carbon and strictly control the blind expansion of high-carbon emission industries.

Guide key enterprises to carry out carbon peak and carbon neutrality actions. Encourage key energy production enterprises and high-carbon emission enterprises in the province to carry out carbon dioxide emission peak actions.

Guide enterprises to formulate peak action plans and encourage large state-owned enterprises in the province to take the lead in achieving peak. Encourage leading enterprises in the industry to actively carry out carbon neutrality actions and clarify carbon neutrality

and goals and paths to guide the upstream and downstream of the industrial chain to collaboratively achieve the goal of carbon neutrality.

(IV) Strengthening the implementation of carbon emission peak targets

Implement the carbon emission peak target responsibility. All localities strictly implement relevant work tasks and formulate peak year action plans according to the provincial peak action plans and municipal peak action plans.

Strengthen the process management of reaching the peak target, strengthen guidance to local governments, strengthen situation analysis and incentive supervision, and ensure that the peak target is achieved as scheduled.

Strengthen the tracking, evaluation and assessment of carbon emission peak. Incorporate the implementation of carbon emission peak action into the provincial ecological environment protection supervision. Establish provincial carbon emission peak target

An evaluation and assessment system is established to conduct annual assessments on the implementation of carbon emission peak actions in various regions, and the assessment results serve as one of the important bases for the assessment and evaluation of local governments.

V. Strengthening Actions to Adapt to Climate Change

Focus on the smooth and safe operation of infrastructure, strengthen spatial layout optimization and the application of advanced technologies, and enhance the resilience of facilities. Focus on agriculture, forests and other ecological

We will focus on improving the ability to adapt to climate change in key areas such as the coastal zone and vulnerable areas, and strengthen monitoring, early warning, and disaster prevention and mitigation of extreme climate events.

Build a disaster prevention and control system to enhance the sustainability of economic and social development.

1. Strengthening the climate adaptability of infrastructure

Strengthen the adaptability of municipal infrastructure. Fully consider the impact of climate change in urban and rural construction planning, and explore new city site selection, urban expansion, and township construction.

Conduct climate feasibility studies. Actively respond to the heat island effect and urban waterlogging, appropriately improve urban flood control and waterlogging standards, preserve and gradually repair urban river networks, and encourage

Encourage the construction of public places such as city squares and parking lots to adopt water seepage design. Gradually improve the construction and operation standards of urban lifeline systems such as power supply, drainage, gas, and communications.

To ensure the smooth and safe operation of infrastructure under extreme weather and climate conditions. Deepen the construction of sponge cities and adopt measures such as "seepage, retention, storage, purification, use and discharge"

Measures will be taken to minimize the impact of urban development and construction on the ecological environment and to absorb and utilize more than 70% of rainfall locally.

Strengthen the adaptability of water conservancy infrastructure. Deepen the "Five Water Governance" and implement major water conservancy projects such as the 100 billion yuan seawall safety project and 100 100 billion yuan project to improve flood control and tide prevention capabilities.

Strengthen the digitalization and informatization of water conservancy infrastructure monitoring and forecasting; implement water resources optimization allocation projects to improve water supply resilience and the ability to cope with extreme droughts; strengthen the digitalization and informatization of water conservancy infrastructure monitoring and forecasting;

Improve the ability of facilities to cope with climate change. Explore the dynamic assessment of climate risks of infrastructure such as reservoirs, optimize and adjust the construction and operation standards of large-scale water conservancy facilities, and ensure

Safe operation of facilities.

Strengthen the adaptability of transportation infrastructure. Strengthen climate risk assessment for safe operation of transportation facilities, and target areas prone to geological disasters such as landslides and mud-rock flows.

In the region, research and develop emergency mechanisms to improve the ability to respond to extreme climate events and ensure the smooth and safe operation of transportation facilities. The planning and design of new transportation infrastructure should be fully

Climate change factors are fully taken into consideration, and enhanced designs are adopted for road sections that are sensitive to climate change.

Strengthen the adaptability of energy infrastructure. In the construction and operation of nuclear power, wind power, hydropower, and photovoltaic power generation projects, fully consider climate change factors and explore

Conduct climate change risk assessments. Appropriately adjust the wind, pressure, and frost resistance standards for power transmission and transformation facilities, and improve emergency response plans. Strengthen safety and security of power grid operations, mining,

Machine Translated by Google

Meteorological services for offshore oil and gas production, etc.

2. Improving climate adaptation in key areas

Improve agricultural climate adaptability. Take full account of climate change factors and optimize the layout of modern planting and fishery productivity. Explore the implementation of farmland climate adaptability assessment.

Accelerate the development of modern seed industry, cultivate and select seeds with strong adaptability such as high temperature resistance, cold resistance, drought resistance and waterlogging resistance.

Properly adjust the planting period to enhance the drought and flood resistance of crops. Promote and apply various agricultural adaptive technologies such as dryland farming, drought resistance and soil moisture conservation according to local conditions.

Improve agricultural disaster warning and prevention systems, and actively

We will promote agricultural climate disaster insurance. We will continue to implement the high-standard farmland construction project, and by 2025, we will have built or renovated 3 million mu of high-standard farmland.

Column 2 Key tasks for agricultural climate adaptation
Improve the coordination mechanism for agricultural adaptation. Establish a coordination mechanism for agricultural adaptation, strengthen overall coordination and goal orientation, and focus on establishing and improving
Improve the working mechanisms in agricultural infrastructure construction, optimize agricultural planting systems, enhance disaster reduction and prevention capabilities, and improve the agricultural insurance system.
Formulate relevant technical specifications for agricultural adaptation. Based on the agricultural development and meteorological characteristics of Zhejiang Province, formulate relevant technical specifications for farmland facilities, water conservancy facilities, and crops.
Adaptive technical specifications in areas such as wildlife, farmland protection, and disaster early warning and monitoring.
Create pilot projects. Select a number of major agricultural production areas and economic entities with good foundations and characteristics to carry out pilot projects to promote agricultural development,
Focus on improving agricultural adaptability and promoting the application of adaptive technologies, conduct regular evaluations of pilot projects, strengthen target constraints, and pay attention to work guidance.
Timely summarize effective adaptation technologies and working mechanisms and promote them throughout the province.

Improve the climate adaptability of forestry. Strengthen the effective protection of forest resources and the construction of ecological public welfare forests, increase the protection of forest and natural forest resources, increase fire resistance,

The proportion of tree species that are drought (humidity) resistant, pest-resistant, and temperature-resistant should be increased, and the monitoring and prevention of forest disasters such as fires and harmful biological invasions should be strengthened to improve forest ecology.

Improve the system's ability to adapt to climate change. Develop new business formats such as forest health and tourism without damaging the forest's ability to adapt to climate change.

Increase efforts to protect and restore other ecosystems. Adhere to the concept of nature-based solutions, further increase efforts to protect and restore ecosystems, and improve cultivated land and forests.

We will establish a system for rest and recuperation of forests, rivers, and lakes, and establish a market-oriented and diversified ecological compensation mechanism. We will further improve the wetland protection system, strengthen wetland restoration and comprehensive management,

We will strengthen wetland protection, continue to improve the marine fishing moratorium system, and effectively restore marine ecological functions.

3. Promoting adaptation to climate change in key regions

Carry out coastal zone adaptation to climate change. When compiling or revising various marine-related plans, fully consider climate change factors. Relying on the construction of the province's island garden,

Systematically promote island ecological protection and restoration. Implement mangrove restoration and coastal wetland restoration projects to protect ecosystems such as mangroves, seagrass beds and salt marshes. Actively promote

Use advanced marine aquaculture technologies such as aquaculture outside shallow bays and bottom aquaculture in deep waters to accelerate the construction of standardized facility fishery bases, rationally adjust aquaculture varieties,

Density, cycle, and develop diversified marine aquaculture products. Strengthen the implementation of the "Blue Bay" remediation action, and fully implement the total amount of pollutants entering the sea and the marine ecological red line.

Strengthen the analysis of the impact of climate change on the coastal zone and carry out special actions to deal with marine plastic waste.

Climate change risk assessment: By 2025, the natural coastline retention rate of the mainland will be no less than 35%, and the natural coastline retention rate of islands will be no less than 78%.

Improve the level of climate adaptation in vulnerable areas. Explore the establishment of a climate change vulnerability indicator system for vulnerable areas such as the mountainous areas in southern Zhejiang, and conduct climate change vulnerability assessments.

Assessment. Establish a climate change impact monitoring system and strengthen monitoring of the impact of heat waves, debris flows, landslides and other disasters on economic and social development and the ecological environment.

Promote the construction of an important ecological barrier for Beautiful Zhejiang in southern Zhejiang, and formulate and implement a national land space ecological restoration plan.

4. Establish and improve a climate disaster prevention and mitigation system

Strengthen the monitoring, assessment, prediction and early warning of climate disasters. Relying on information construction and big data applications, strengthen the basic information collection and data analysis of climate disasters, explore

Conduct climate disaster monitoring and assessment in key departments and key areas. Promote the construction of a climate disaster monitoring network covering the entire province, and improve the monitoring of drought, low temperature, rain, snow, ice and storms.

The forecasting, warning and response capabilities of extreme weather such as rain and typhoons, and natural disasters such as forest fires, landslides, mudslides and debris flows.

Conduct adaptive assessment research to expand the application scope of assessment results.

Improve the climate disaster emergency plan system and response mechanism. Establish and improve emergency plans and supporting systems for dealing with extreme climate events, and improve emergency linkage and

Social response system, strengthen the construction of emergency channels, disaster relief material storage centers, etc., improve the emergency management level such as rescue response speed and emergency rescue coverage, and enhance

Ability to respond to extreme climate events: By 2025, the average proportion of meteorological disaster losses to regional GDP will not exceed 2%.

VI. Improving governance capabilities to address climate change

Adhere to the system concept, focus on the construction of climate change system, coordinated governance of pollution reduction and carbon reduction, scientific and technological support, digital empowerment, market mechanism, talent team and other important issues.

In terms of key points, we will earnestly advance the reform and exploration work to address climate change, and strengthen the modernization of the governance system and governance capabilities to address climate change.

1. Establish and improve a system to address climate change

Improve the carbon emission target control system. Incorporate the carbon emission intensity reduction target into the comprehensive evaluation and performance assessment system of economic and social development, and strengthen indicator constraints.

Establish a dual control system for total carbon emissions and intensity, formulate a method for evaluating and assessing the carbon emissions dual control target responsibilities, and encourage local governments to explore and innovate the carbon emissions dual control management system.

Accelerate the establishment of a mechanism for decomposing and implementing the total carbon emissions in the province, and reasonably determine the total carbon emissions control targets and tasks for each region, key area and industry.

Machine Translated by Google

Research and establish a greenhouse gas emission permit system and a carbon emission evaluation system. Explore the construction of a carbon emission permit system that matches the total carbon emission control system.

Standardize and constrain the behavior of emission units, and form a carbon emission rights property system with clear ownership, clear rights and responsibilities, and effective supervision. Carry out carbon emission assessments for key industry construction projects

The carbon emission assessment system will be established, carbon emission assessment will be included in the environmental impact assessment, and the incremental carbon emission of major projects will be strictly controlled.

Use scenario innovation to promote the continuous expansion of carbon emission assessment applications. Explore the formation of a unified carbon emission assessment database across the province, cultivate third-party carbon emission assessment institutions, and build

Establish a supervision and regulatory mechanism for carbon emission evaluation. Carry out joint research on carbon emission and carbon emission reduction measurement technology to improve the accuracy of carbon emission accounting.

Deepen the statistical system for addressing climate change. Further improve the statistical, accounting, reporting and verification system for basic carbon emission data. Continue to improve the system covering energy activities,

Statistical systems in the fields of industrial production processes, agriculture, land use change and forestry, and waste disposal. Establish a greenhouse gas inventory assessment mechanism.

Improve the digitalization and intelligence level of inventory compilation, strengthen economic and social activities, ecological and environmental protection big data, high-time remote sensing data, and high-spatial resolution land use data

We will use multi-source big data applications to accelerate the development of rapid carbon emissions accounting and assessment systems for different regions and sectors, and improve the timeliness of carbon emissions accounting.

Promote the establishment of a greenhouse gas emissions information disclosure system. Promote the implementation of data reporting, quota settlement and compliance of key emission units in the carbon emissions trading market.

As the legal disclosure content of corporate environmental information, relevant illegal and irregular information will be recorded in the corporate environmental credit information.

Companies in the decentralized trading market are the first to publish information on greenhouse gas emissions and action measures to control emissions.

2. Building a coordinated governance system for pollution reduction and carbon reduction

Establish a coordinated emission reduction management mechanism. Improve the "one-certificate" comprehensive environmental management system and integrate greenhouse gas emission reduction into the "one-certificate" management of pollutant emission permits.

The integration and application of greenhouse gas inventory reports, greenhouse gas emission reports of key enterprises and emission permit implementation reports, etc., establish a coordinated governance system for pollution reduction and carbon reduction

Integrate greenhouse gas and air pollutant management measures, focus on source control, and develop

Carry out coordinated management of greenhouse gas emissions from solid waste and wastewater treatment facilities.

Lay a solid foundation for coordinated emission reduction. Select typical cities and regions to carry out pilot projects to achieve both air quality standards and carbon emissions peak, and create a number of model cities that have both.

Promote the integration of pollution permit system and carbon emission reduction measures in industries such as steel, building materials and nonferrous metals, and include key carbon emission enterprises in the daily supervision of pollution sources.

The emission reporting, monitoring and verification system will be integrated with the pollutant emission permit system to promote the unified collection and coordination of data related to pollutant and greenhouse gas emissions from enterprises and institutions.

Explore pilot demonstrations of coordinated reduction of air pollutants and greenhouse gases, and select technologies for coordinated reduction of greenhouse gases and air pollutants.

technology and collaborative governance strategies, and establish a technology application toolbox.

Column 3 Key tasks for coordinated emission reduction
Establish and improve the statistical accounting, monitoring and guarantee system for coordinated emission reduction. Taking the control of both air quality and carbon peak as the starting point,
With the goal of strengthening the effect of coordinated emission reduction, we will promote the establishment of a working system for coordinated emission reduction among enterprises and industrial parks.
Statistical accounting system, monitoring system and guarantee system for coordinated emission reduction. Promote Huzhou City to carry out pilot construction of carbon emission monitoring and management platform
point.
Implement pilot projects for coordinated emission reduction. Select a number of high-energy consumption, high-pollution, high-emission industrial parks and key emission enterprises to carry out pilot projects.
The core is to achieve both the target of carbon emission reduction and the peak carbon emission reduction. We will regularly assess the progress of the pilot projects, summarize the excellent experiences and practices in a timely manner, and gradually promote them to the whole country.
Promotion among the province's key emission enterprises and parks.

Explore the coordinated emission reduction linkage system in the Yangtze River Delta. Actively participate in the national strategy of Yangtze River Delta integration, jointly explore an eco-friendly and high-quality development model, and solidly promote

Jointly develop new technologies to address climate change, jointly explore the establishment of a regional linkage mechanism for pollution reduction and carbon reduction, and

It provides solid support for the high-quality development of the region and the construction of a beautiful Yangtze River Delta.

3. Strengthening scientific and technological innovation in the field of climate change

Organize and carry out technical research in key areas. Increase support for basic research, technology development and strategic policy research in the field of climate change to make decisions on climate change.

Based on the actual development of Zhejiang, we will implement the "Double-leading and Double-leading" plan in depth, focusing on "zero-carbon" electricity, "zero-carbon" non-electric energy, and "zero-carbon" processes.

Innovate the scientific research mechanism in five major directions, including plastic, "zero carbon" system, carbon capture, utilization and storage (CCUS) and carbon sink. Actively integrate into the innovation cooperation in the Yangtze River Delta region.

Build a platform for international scientific and technological cooperation and establish a collaborative development ecosystem. Strengthen data integration and data promotion, and deeply explore the application of Internet technologies such as big data and cloud computing.

The application value in the field of climate change will strengthen the deep integration of "Internet +" and low-carbon development technologies.

Strengthen the construction of high-level innovation platforms. Focus on the research of hydrogen energy utilization, solar energy utilization and clean and low-carbon energy, and plan to build a provincial experiment in the field of energy.

We will strengthen the construction of national key laboratories such as clean energy utilization, fluorine-containing greenhouse gas substitution and control treatment. We will actively strive for national-level scientific and technological innovation bases and promote Long

Leading enterprises will take the lead in establishing provincial technology innovation centers, forming innovation consortia, accelerating the construction of a dynamic high-end innovation system for carbon neutral technology, and creating domestic leading low-carbon technology

Innovation base.

Promote the transfer and transformation of scientific and technological achievements. Deeply implement the first machine (set) upgrade project, regularly publish green technology promotion catalogues, and give full play to the support of the Innovation Guidance Fund.

Implement the national green technology innovation demonstration and pilot action, implement the transformation of low-carbon advanced technology achievements, and innovate the cultivation and

Sustainable development demonstration and leadership. Taking the establishment of the National Green Technology Exchange Center as an opportunity, we will increase the carbon peak and carbon neutrality technology transformation efforts, and vigorously cultivate green and low-carbon technology.

Technology innovation enterprise.

Machine Translated by Google

4. Leverage the advantages of digital climate governance

Accelerate the construction of comprehensive application scenarios. In accordance with the requirements of "cross-domain, scenario-based, large-scale, and small-scale", integrate multi-domain and multi-dimensional data from the province to create a carbon peak and carbon The digital intelligence platform for carbon peak and carbon neutrality will be established, and a digital system for carbon peak and carbon neutrality will be drawn. Real-time reflection of the province's carbon emission status and timely assessment of production and demand will be conducted. Contributions of industrial transformation and upgrading, energy structure adjustment, and energy efficiency improvement to carbon peak.

Establish a carbon account management system. Make full use of the big data platform to build a clear and accurate carbon account system, strengthen corporate emission reduction responsibilities, and achieve the application for pollution discharge permits. By establishing measurement, accounting and evaluation standards to measure the green and low-carbon development level of enterprises, strengthening monitoring, early warning, evaluation and assessment, and data return, Achieve full-chain closed-loop management. Based on carbon account data, adopt green finance, fiscal and taxation policies and other means to encourage enterprises to save energy and reduce carbon emissions, and promote green and low-carbon transformation of enterprises. Type.

5. Improve the market mechanism for addressing climate change

Strengthen the foundation of carbon trading. Improve the corporate carbon reporting system, improve the carbon emission monitoring, reporting, verification and review system, and guide enterprises to gradually establish carbon trading. Emission record system. Encourage enterprises to do a good job in measuring instrument calibration, coal element testing, etc., to further consolidate the data foundation. Carry out multi-level capacity training to improve Improve the greenhouse gas emission management level and technical capabilities of the ecological environment departments of cities and counties, and enhance the ability of enterprises to participate in national carbon trading.

Fully participate in the construction of the national carbon market. Clarify the carbon emission trading responsibility targets and improve the work system. Establish a provincial carbon emission quota allocation management mechanism and actively participate in the construction of the national carbon market. Improve the allocation and compliance management of carbon emission quotas for key emission units, improve the market regulation and offset mechanism of carbon emission quotas, and guide enterprises across the province to do a good job in quota compliance and clearance. Explore and conduct research on the paid use and transfer mechanism of carbon emission rights.

Promote carbon asset management and development. Encourage enterprises to carry out carbon asset management, establish carbon asset management departments, and provide supporting information management systems to actively develop forestry carbon assets. Carbon emission reduction projects such as carbon emission reduction from sink projects, carbon emission reduction from energy conservation projects, and other national certified emission reduction projects (CCER) and other carbon emission reduction projects under other mechanisms. Actively explore the development of marine and wetland areas. Cultivate carbon trading service institutions such as carbon trading consulting, carbon asset management, and carbon financial services to promote the carbon market Development of the service industry.

(VI) Strengthening the development of talent team in the climate field

Improve the expert committee and expert database in the field of climate change. In light of the actual work in the field of climate change in our province, further absorb experts in related fields and improve the expert committee and expert database in the field of climate change. The structure of the committee and expert pool covers many fields such as atmosphere, ocean, hydrology, geology, ecology, forestry, energy, transportation, construction, economy, etc. Support institutions, give full play to the advantages of multidisciplinary integration and the leading advantages of experts in this field, and widely organize scientific and technological workers to make plans for our province's response to climate change Measures.

Strengthen the construction of professional teams in the climate field. Accelerate the training and introduction of talents to deal with climate change, expand the professional support team for dealing with climate change, and give full play to the consulting Encourage scientific researchers to participate in international research programs, consolidate the construction of basic research, technology development and strategic policy research bases for addressing climate change, and improve Long-term research support mechanism. Actively cultivate third-party service agencies and market intermediary organizations, establish a low-carbon industry alliance, and strengthen the construction of a reserve team for climate change research. Promote the construction of a talent policy system for addressing climate change and establish a standardized and institutionalized skills certification mechanism.

Strengthen the basic team building in the climate field. Focusing on key and difficult tasks in the climate field, organize and carry out various forms of capacity building activities for grassroots teams. Improve the professional capabilities of grassroots teams in addressing climate change. Rely on technical support institutions to strengthen professional guidance for grassroots teams.

VII. Promote pilot demonstration construction

Deepen the establishment of various pilot projects at all levels to respond to climate change, summarize and extract a number of replicable and popularizable low-carbon development experiences in Zhejiang, and focus on deep emission reduction, climate adaptation and We will carry out frontier work on climate change response, such as carbon neutrality, and plan and promote pilot demonstrations on climate change response in all aspects and with high standards, giving full play to the initiative and creativity of grassroots units. and explore new paths for green and low-carbon development.

1. Create an upgraded version of the low-carbon pilot project

Deepen the national low-carbon pilot projects. Based on the achievements of the pilot projects, combined with the characteristics of different types of pilot projects, benchmark against international advanced levels, identify development gaps and We will explore appropriate low-carbon transformation paths and solve key bottlenecks that restrict low-carbon development. standards, evaluation indicators and assessment methods, strengthen policy and technology innovation practices, and explore differentiated and precise low-carbon development models and diversified low-carbon development paths. Pathways, providing decision-making basis for formulating carbon peak and carbon neutrality action plans for regions and cities.

Comprehensively upgrade provincial low-carbon pilot projects. Deepen the construction of provincial low-carbon cities, counties (cities, districts), towns (towns), parks, enterprises and other low-carbon pilot projects, and promote them throughout the province. Replicate typical experiences and models. Further build a number of pilot cities that conduct in-depth exploration in the fields of total carbon emission control, digital carbon emission governance, and carbon sink capacity building. Cities, counties (cities, districts) will integrate low-carbon concepts into the planning, construction, operation and management of pilot parks and enterprises.

Column 4: Green and Low-Carbon Park Construction
Vigorously develop green and low-carbon industries. Formulate strict low-carbon production and admission standards for industrial parks, and carry out mandatory elimination of high-carbon and backward production capacity and enterprises.
The park will implement low-carbon threshold management for enterprises entering the park and new projects. Focus on cultivating and developing low-carbon industries to form a new industrial park industrial system.
Support the greening, recycling, digitalization and intelligentization of traditional manufacturing industries.

Machine Translated by Google

Promote clean and efficient use of energy resources. Adjust the industrial energy structure of the park, reduce the proportion of fossil fuel consumption, promote distributed energy, and improve

High proportion of renewable energy use. Optimize the industrial chain and production organization model, promote intensive resource utilization, waste exchange and utilization, and wastewater recycling

Utilization and energy cascade utilization.

Actively carry out research and development and application of green and low-carbon technologies. Strengthen the leading position of enterprises in green and low-carbon technology innovation and encourage enterprises to participate in the industry

Carbon neutrality guidelines and product carbon footprint standards are formulated. Taking the establishment of the National Green Technology Trading Center as an opportunity, we will promote the application of low-carbon technologies.

use.

Accelerate the construction of low-carbon infrastructure. Formulate a green and low-carbon development plan for the park, rationally optimize the spatial layout, adjust the transportation structure,

Implement low-carbon and intelligent construction or upgrade the park's energy and resource infrastructure. Improve the park's various solid waste disposal facilities.

Build and share, and accelerate the construction of sewage treatment pipelines.

Improve the low-carbon management level of the park. Establish and improve the green and low-carbon management system of the park, build an energy resource management platform for the park, and guide the development of the park.

Carry out full life cycle carbon emission management. Carry out corporate carbon account construction, promote low-carbon product certification system and product carbon labeling, and explore multiple ways to

Strengthen the low-carbon construction of the park, increase the publicity of green and low-carbon development of the park, encourage and support the park and enterprises to develop

Carry out carbon neutrality practices.

Establish a low-carbon pilot evaluation mechanism and dynamic adjustment mechanism. Establish a promotion mechanism for annual monitoring, mid-term evaluation, and summary evaluation of the pilot, and timely grasp the implementation of the pilot Progress, summarize the results of the pilot projects, and promote advanced experience. Establish a dynamic adjustment mechanism for pilot projects, take measures such as rectification and elimination for pilot projects with problems in the assessment, and standardize Pilot construction.

2. Construction of "Zero Carbon" Demonstration Pilot Project

Carry out top-level design for the construction of a "zero-carbon" system. Prioritize the county (city, district), township (street), village (community) and other levels, and formulate a "zero-carbon" demonstration pilot construction plan. Accelerate the formulation of carbon neutrality accounting standards and offset mechanisms for products, services, and activities, and strengthen the accounting, recognition, and purchase of carbon neutrality projects. Standardized management of purchase, offset and other processes.

Create multi-point and multi-level "zero-carbon" demonstration pilot projects. Encourage local governments to implement the construction of multi-level "zero-carbon" demonstration pilot projects in an orderly manner based on their own actual conditions, and give priority to supporting projects in mountainous areas. 26 counties and Sanjianghui area in Hangzhou City have started the construction of "zero carbon" demonstration areas. By 2025, 10 "zero carbon" demonstration counties (cities, districts) and 100 "zero carbon" demonstration townships will be built. Towns (streets), 1,000 "zero carbon" demonstration villages (communities), forming a "ten, hundred, thousand" "zero carbon" demonstration system. Encourage and guide large-scale activities to follow the "Carbon Neutrality for Large-scale Activities" The Implementation Guidelines (Trial) will take the lead in carbon neutrality practices, focus on supporting Hangzhou in planning and promoting carbon neutrality for events with international influence such as the Asian Games, and Strengthen experience exchange and publicity and promotion of typical cases.

Deepen the innovation, research and development and application of "zero-carbon" technologies. Focus on the fields of renewable energy, energy storage, hydrogen energy, and ecosystem carbon sinks to carry out technical research. Promote the scale of The introduction, research and development, industrialization and application promotion of carbon capture, utilization and storage (CCUS) technology in the whole chain will be carried out, and pilot demonstration projects will be carried out in selected regions and industries with conditions. Fan.

Column 5 "Zero Carbon" Demonstration Pilot Construction Project

Focus on the "10, 100, 1000" "zero carbon" demonstration system, and encourage counties (cities, districts), towns (streets), villages (communities) and other grassroots organizations to deepen the "zero carbon" internalization.

We should implement the creation of ecological civilization, develop low-carbon industries, promote the application of clean energy or renewable energy, strengthen the construction of "zero-carbon" buildings,

Build transportation infrastructure, promote green production and living styles, and create an all-round and multi-level "zero-carbon" demonstration model.

"Zero-carbon" park construction. Implement low-carbon threshold management, build a circular economy industrial chain, cultivate green and low-carbon industries, and demonstrate and promote carbon capture and utilization.

Use and storage (CCUS) technology, explore the establishment of a synergistic mechanism for pollution reduction and carbon reduction, with the reduction of carbon emissions per unit of industrial added value and the reduction of industrial production

The main goal is to continuously reduce greenhouse gas emissions during the process and form a "zero-carbon" park model with its own characteristics.

"Zero-carbon" public institutions. Encourage government agencies, schools, hospitals and other public institutions to promote the use of green buildings and renewable energy buildings.

In the process of operation, we advocate green business philosophy, take energy-saving and carbon-reduction measures, and encourage various public institutions to

Practice carbon neutrality in action, and by 2025, build 300 "zero-carbon" public institutions at or above the township level.

"Zero carbon" enterprise. Create a green supply chain, transform production processes, establish a low-carbon management standard system, and improve the utilization rate of energy and resources.

Select low-carbon materials, reduce product energy efficiency, improve enterprise operation and transportation efficiency, apply the "renewable energy + energy storage" technology model, and strengthen sustainable development.

Increase the proportion of renewable electricity consumption, seek nature-based solutions, and explore the path to achieving "zero carbon".

3. Building pilot projects for adaptation to climate change

Establish and improve the pilot coordination mechanism. Improve the normalized management system of multi-departmental joint prevention and linkage. According to the key areas of transportation, agriculture, forestry, ocean and other fields to adapt to climate change Task: in accordance with the requirements of climate risk management, explore and formulate field and regional standards for pilot projects to adapt to climate change.

Carry out pilot projects for adapting to climate change. Deepen the construction of Lishui National Climate Adaptive City Pilot Project and summarize the pilot experience. Comprehensively consider climate type, geographical location, Based on the regional characteristics, development stage and work basis, select appropriate cities to carry out climate-resilient city construction pilot projects, explore urban adaptation to climate change that is in line with local conditions Construction management model. Focus on key areas such as ecological functional areas, coastal areas and islands, and in energy, transportation, construction and infrastructure safety, agricultural and forestry production, and marine economy. Pilot work is being carried out in key areas such as economic development.

Promote the research, development and application of various climate adaptation technologies. Explore and build reasonable and effective climate adaptation technology for different regions and fields. Select appropriate cities and fields to carry out pilot construction of various types of adaptive technologies.

4. Promoting climate investment and financing pilot projects

Improve the climate investment and financing mechanism. Strive to implement the national climate investment and financing policy in Zhejiang. Improve the supporting policy system for climate financing and formulate a negative investment list.

Restrain high-carbon investment, explore the use of various means such as investment subsidies and loan interest subsidies, innovate incentive and constraint mechanisms to promote corporate emission reduction, and give full play to the expected guidance of carbon emission standards

And the reverse pressure promotion effect, make good preparations for climate projects.

Improve the climate investment and financing standards system. Use the benefits of addressing climate change as a measurement indicator, and integrate it with the existing relevant technical standards system and the Green Industry Guidance Catalogue.

Promote research on statistical indicators for climate investment and financing, and encourage the establishment of a climate investment and financing system.

Financing statistics monitoring platform. Accelerate the formulation of information disclosure standards for climate investment and financing projects, entities and funds. Establish climate performance evaluation standards and encourage credit rating agencies to

Integrate environmental, social and governance factors into rating methodologies.

Promote innovation in carbon finance products and services. With the goal of achieving carbon peak and carbon neutrality, improve the green finance system and guide financial resources towards green and low-carbon development.

Explore and promote innovative businesses such as mortgage and pledge of carbon emission rights assets, repurchase business, carbon leasing, and carbon asset securitization.

Improve the financial incentive and constraint mechanism and encourage financial institutions to explore differentiated investment and financing models.

5. Carry out the "Carbon Labeling" pilot

Build a "carbon label" standard system. Conduct research on "carbon label" methodology. Select representative industries and products to carry out carbon labeling, carbon footprint methodology and standards.

We will study technical specifications such as the system and explore the establishment of a complete regional carbon footprint accounting, certification and supervision system.

Promote the application and promotion of "carbon labeling". Support and encourage regions and enterprises with the foundation, ability and willingness to take the lead in carrying out carbon labeling practices, accumulate experience and data,

Gradually promote the implementation of the "carbon label" system. Increase government procurement support and increase the proportion of "carbon label" products in government procurement. Guide foreign trade enterprises to promote carbon labeling.

labeling system, and actively respond to green trade rules such as the "Carbon Border Adjustment Mechanism". Increase the publicity of "carbon labeling" to enhance residents' awareness of practicing green and low-carbon life.

knowledge.

8. Strengthening organization and implementation

1. Strengthen overall planning and coordination

Better play the leading role and overall coordination function of the Joint Conference on Climate Change and Energy Conservation and Emission Reduction, strengthen centralized management, actively implement responsibilities, and improve

Regularize the cooperation mechanism to promote resource integration and utilization and information data sharing. Make good connections between this plan and relevant provincial special plans, and strengthen the city-level response to climate change.

Change the connection between special plans and this plan to ensure that the objectives of relevant plans are consistent, have different focuses, and are coordinated and complementary.

2. Strengthening supervision and assessment

Strengthen the decomposition of goals and tasks, comprehensively consider factors such as the economic development level, industrial structure, energy-saving potential, and environmental capacity of various regions, and reasonably determine the greenhouse gas emissions of various regions.

The outstanding problems in the work related to climate change and the implementation of the targets and tasks will be included in the comprehensive evaluation and performance evaluation of various regions and departments.

Effectiveness assessment system. Carry out annual monitoring, mid-term assessment and summary assessment of plan implementation, timely grasp the progress of plan implementation, and ensure the full completion of plan goals and tasks.

Strengthen the target responsibility system for controlling greenhouse gas emissions, and use the evaluation results as an important basis for improving government work and performance appraisal.

3. Increase financial support

Give full play to the guiding role of fiscal funds, effectively increase financial support for climate change response work, and implement financial guarantees.

To the cities and prefectures that have made significant progress and achieved remarkable results, appropriate preference will be given to them in allocating provincial ecological and environmental protection special funds. To expand diversified investment and financing channels, promote and guide financial institutions to actively

Extremely innovative, providing flexible and diverse products and services to address climate change.

4. Focus on low-carbon publicity

Regularly summarize advanced models and successful cases of addressing climate change and "zero-carbon" development, form Zhejiang experience for publicity and reference, and make full use of the national "Belt and Road"

We will also actively participate in the "One Belt, One Road" government cooperation, South-South cooperation on climate change and other platforms, and widely mobilize provincial government departments, relevant enterprises, social organizations and research institutions to participate.

Spread and share Zhejiang's experience in low-carbon transformation of the economy and society. Carry out publicity activities such as World Environment Day, National Low Carbon Day, and Energy Conservation Publicity Week to create a good social public opinion.

On the environment. Give full play to the role of social organizations, organize various forms of popular science activities, and promote the spirit of green, low-carbon, diligence and thrift.
