Sichuan Provincial People's Government

Notice on Issuing the "Sichuan Province's 14th Five-Year Plan for Ecological and Environmental Protection"

Sichuan Provincial Government Document No. 2022

To the people's governments of all cities (prefectures), all departments and directly affiliated institutions of the provincial government, and relevant units:

The "Sichuan Province's 14th Five-Year Plan for Ecological and Environmental Protection" is now issued to you.

Really organized and implemented.

Sichuan Provincial People's Government

January 12, 2022

Preface

To implement General Secretary Xi Jinping's "Building the Upper Yangtze River Ecological Barrier and Maintaining The important instruction of "putting national ecological security in the first place in the construction of ecological civilization" has promoted Sichuan has made new progress in ecological civilization construction. The planning work deployment is based on the new development stage, implementing the new development concept, and building a new Under the background of the development pattern, according to the Fourteenth National Economic and Social Development The Outline of the Five-Year Plan and Long-Term Goals for 2035 was formulated, and the Sichuan Province's 14th Five-Year Plan for "Ecological Environment Protection Plan".

This plan is to coordinate and promote the ecological environment protection work in our province during the "14th Five-Year Plan" period. When formulating relevant plans, action plans, policies and measures, we should strengthen the coordination with this Regulation. The planning period is until 2025, and the long-term vision is to The year 2035.

Machine Translated by Google

I. Ecological and Environmental Protection Situation

(1) The ecological environment protection has achieved remarkable results.

The whole province earnestly studied and implemented Xi Jinping's ecological civilization thought and General Secretary Xi Jinping's A series of important instructions on Sichuan's work, fully implementing the decisions of the CPC Central Committee and the State Council deployment, earnestly shoulder the important political responsibility of maintaining national ecological security, and vigorously promote We will continue to promote ecological civilization construction and ecological environment protection, resolutely fight the tough battle against pollution, and The blue sky and white clouds, clear water and green banks around us have increased significantly, and the environmental "appearance" has generally improved. Sichuan has taken solid steps in its construction.

The provincial party committee and government insist on putting ecological civilization construction and Ecological environmental protection is placed in a prominent position in the overall work, and a The responsible person shall serve as the co-director of the Provincial Ecological and Environmental Protection Committee. Improve relevant policies and laws The Sichuan Province Tuojiang River Basin Water Environment Protection Regulations and the Sichuan Province Minjiang and Tuojiang River Basin Water Environment Protection Regulations were promulgated. "Emission Standards for Water Pollutants in the Yangtze River Basin" "Implementation Plan for Building a Modern Environmental Governance System Opinions" and other laws, regulations and normative documents, and took the lead in establishing the "Three Lines and One "List" (ecological protection red line, environmental quality bottom line, resource utilization upper line and ecological environment standard Incorporate ecological and environmental protection work into the provincial party committee, The provincial government has integrated the performance evaluation of the goals and given it a higher weight, further tightening the pressure on local governments responsibility.

The response to climate change has achieved remarkable results.

The construction of the "Three Rivers" hydropower base has achieved a total installed capacity and power generation of renewable energy. 878.25 million kilowatts and 367.74 billion kilowatt-hours, accounting for 1.3% and 2.6% of the province's total installed power capacity and power generation respectively.

. Accelerate the exploration and development of natural gas (shale gas) and build the country's highest 85.3% and 88.8%

Machine Translated by Google

Large natural gas (shale gas) production base. Promote the implementation of electric energy substitution and clean energy substitution

The coal consumption has been steadily reduced, and the proportion of non-fossil energy in energy consumption has reached

38%, basically forming an energy consumption structure dominated by clean energy.

Chengdu and Guangyuan are pilot cities for low-carbon development and pilot cities for climate-adaptive development

The results of the project are obvious, and a number of provincial-level low-carbon communities have been built.

Carbon dioxide emissions and energy consumption per unit of GDP decreased by 29.9% and 17.4% respectively ÿ

The quality of the atmospheric environment has improved significantly. The implementation plan for winning the battle to protect blue skies has been issued.

A series of policy documents have been issued to define key areas for air pollution prevention and control, and to strengthen the Chengdu Plain, southern Sichuan,

Joint prevention and control of air pollution in northeastern Sichuan. Accelerate industrial restructuring, the 13th Five-Year Plan

During the period, the province has withdrawn obsolete production capacity from 1,218 enterprises, reducing crude steel production capacity by 497

1.7 million kilowatts of coal-fired power units were shut down, and the fuel

Eliminate small coal-fired boilers. Promote low (no) volatile organic compound substitution and guide enterprises to formulate

"One enterprise, one policy" plan. In 2020, the number of cities (states) that meet air quality standards

The number of days with good or good weather conditions increased from 5 in 2015 to 14; the proportion of days with good or good weather conditions in the province was 90.7%, which was higher than that of the previous year.

In 2015, it increased by 5.5 percentage points; the province's PM2.5 The average concentration was 31 ÿg/m3, relatively

Compared with 2015, the province's sulfur dioxide and nitrogen oxide emissions decreased by 26.2%;

The figures for the first and second half of this year dropped by 26.4% and 19.7% respectively, both exceeding the national targets.

The water environment quality has been greatly improved. The river and lake chief system has been fully implemented to promote the comprehensive management of river basins.

We will implement the supervision of key small watersheds, eliminate Class V sections, and prevent three types of phosphorus pollution.

Special actions such as tackling water pollution have been launched to continuously promote the treatment of black and odorous water bodies.

Centralized sewage treatment facilities have been built in the development areas. Strengthening rural domestic sewage treatment,

58. 4% of administrative villages have had their domestic sewage treated. Strengthen the protection of drinking water sources and complete

Machine Translated by Google

389 drinking water sources were rectified, and the water quality of drinking water sources at the county level and above was improved.

The compliance rate is 100%, and the compliance rate of rural centralized drinking water sources has exceeded the standard for the first time.

90% ÿ In 2020, the proportion of excellent water quality in sections under provincial control and above in the province is

94.5%, an increase of 33.2 percentage points over 2015, of which the proportion of good water quality in the national controlled sections

The water quality of 13 sections out of Sichuan was 98.9%, an increase of 26.4 percentage points compared with 2015.

The chemical oxygen demand and ammonia nitrogen emissions decreased by 14.9% compared with 2015. ÿ

15. 3%, all exceeding the national targets.

The overall soil environmental quality remained stable. A soil pollution prevention and control action plan was formulated and issued.

The Sichuan work plan and other series of policy documents have been completed to comprehensively complete the status of agricultural land soil pollution.

Detailed investigation and land use survey of key industries and enterprises, and completed soil pollution status of 222 key areas.

Conduct risk investigation and rectification, self-monitoring and other work to assess the soil environment in the province.

Gradually find out. Establish a list of soil pollution risk control and remediation for construction land in the province and implement

We will further implement the classification of domestic waste and carry out pilot projects on the classification of hazardous waste.

The harmless treatment rate of urban domestic waste reached 99.8%, an increase of 17.7 percentage points compared with 2015.

The centralized disposal capacity of general industrial solid waste and hazardous waste will be gradually improved by 2020.

In 2017, the province's hazardous waste utilization and disposal capacity reached 3.66 million tons/year, and medical waste was concentrated in

The disposal capacity reaches 147,000 tons/year.

Ecological protection and construction are more powerful. Accelerate the construction of the Giant Panda National Park and strengthen

The protection of nature reserves and the construction of ecological barriers in the upper reaches of the Yangtze River and the Yellow River have achieved remarkable results.

During the 13th Five-Year Plan period, the province completed 8.3 million hectares of afforestation.

9.02 million mu of grassland ecological restoration, 58,000 mu of medium and severe desertification land treatment,

The forest coverage rate has increased from 36% to 40%. The biodiversity protection work has achieved remarkable results.

Machine Translated by Google

There are 525 nature reserves of various levels and types in the province, with a total area of about 131,000 square kilometers.

Completed the provincial ecological protection red line assessment and natural protection area optimization and adjustment,

The ecological protection red line area has increased to 149,000 square kilometers, accounting for 2.3% of the province's total area.

reserves. Actively carry out the "Green Shield Action" to protect 30.7% of the 32 national nature

We will focus on cleaning up and supervising eight types of problems, including quarrying and sand mining. We will actively promote the demonstration of ecological civilization.

The province has built 14 national ecological civilization demonstration counties and

There are 4 "Gold and Silver Mountains" practice and innovation bases.

The level of environmental supervision capability has been rapidly improved.

Reform and adjust law enforcement and monitoring agencies, and establish provincial, municipal and county comprehensive ecological and environmental protection agencies.

We will make every effort to promote the central ecological environment protection inspection to find problems and the Yangtze River Economic

The Economic Zone has highlighted the rectification of ecological and environmental problems and was the first in the country to complete the provincial environmental protection inspection

and "look back" to cover all areas. Issued and implemented a positive list of supervision and law enforcement, and carried out

Yunnan jointly enforces environmental laws and has carried out law enforcement inspections on approximately 110,000 companies during the 13th Five-Year Plan period.

The environmental monitoring network has been continuously improved, with a total of about 28,000 monitoring points built, an increase of 1.3% from 2015.

Increase by 30%, achieve basic coverage of the whole province and basically complete elements. Coordinate 260 million yuan of special

The funds are used to configure monitoring equipment and emergency supplies, with a focus on more than 50 counties and districts in urgent need of emergency supplies.

Strengthen risk prevention and control, establish an environmental risk early warning and prevention system, and improve cross-border and cross-border

River and cross-departmental environmental emergency linkage mechanism, no one occurred in the province during the "Thirteenth Five-Year Plan" period.

Major or above environmental emergencies.

(2) Main problems and shortcomings

Like the rest of the country, Sichuan is still facing a period of heavy pressure and burden in ecological civilization construction.

During this critical period, long-term contradictions between protection and development and short-term problems are intertwined, and the ecological environment protection structure

Machine Translated by Google

The overall pressures of the nature, root causes and trends have not been fundamentally alleviated. Entering a new stage of development, the whole

The province's ecological environment protection work still faces some problems and challenges, and the construction of ecological civilization is arduous.

The road is long.

The results of environmental governance are not yet stable, and it is becoming more difficult to continuously improve environmental quality.

The pollution prevention and control situation remains severe. One-third of the cities (prefectures) and nearly half of the counties (cities,

The air quality in some cities (region) does not meet the standards, with PM2.5 The concentration is still at a high level, and it continues in autumn and winter.

Continuous pollution is still prominent, and ozone pollution has a prominent impact in spring and summer. Surface water environment

The results of the remediation are not stable. The Carbon Research Institute of the Tuojiang River Basin, the Mangxi Bridge of the Minjiang River Basin, and the Liquan River Estuary

The cross-border sections of Sichuan and Chongqing such as Yaoshi River Baisha, Pingtan River Niujiaotan, etc.

The water quality situation is not optimistic. Some drinking water source protection areas have problems such as over-border development and protection.

The environmental monitoring and early warning emergency response capabilities are relatively weak.

The environment has not been fundamentally improved, and soil levels in agricultural land in some areas still exceed standards.

The structural contradictions of the ecological environment are prominent, and the prevention and control of environmental pollution sources still need to be strengthened.

The province's industrial structure is not optimal, with high-energy-consuming industries accounting for a relatively high proportion. The energy structure still needs to be greatly optimized.

The supply capacity and transmission and utilization scale of clean energy such as space, wind, solar, and water needs to be improved.

The transportation structure is not optimal, with a high proportion of road freight, and only a small proportion of railway and water freight.

for 7%. The land use structure is unreasonable, and the phenomenon of industrial siege and chemical enterprises distributed along the river accounts

The resource and environmental carrying capacity of some areas has reached or is close to the upper limit.

Emission intensity of major pollutants such as chemical oxygen demand, nitrogen oxides, and volatile organic pollutants

Higher than the national average.

There are shortcomings in the construction of environmental infrastructure, and the operation and maintenance capabilities need to be improved urgently.

Insufficient domestic sewage collection and treatment capacity, lagging sewage collection network construction, and sludge is harmless

Machine Translated by Google

The waste classification and collection system is not yet sound.

The urban domestic waste disposal system needs to be further improved, and the collection and transportation of waste in towns and rural areas should be strengthened.

The system needs to be strengthened. The centralized incineration facilities for domestic waste have insufficient processing capacity, and kitchen waste

The treatment level is low. The general solid waste disposal capacity is insufficient and the comprehensive utilization level is low.

Insufficient use of economic and legal means of ecological environmental governance, and insufficient governance system and governance

The modernization of environmental governance system and environmental governance capacity needs to be strengthened urgently.

The governance system with government leadership, enterprise responsibility and social participation is not yet sound.

The internal motivation of relevant responsible entities for ecological and environmental protection is still insufficient and cannot meet the ecological

High-level environmental protection is needed. Environmental economic policies and legal systems need to be improved.

The level of modernization, technology and digitalization in law enforcement, monitoring and surveillance is low.

The level of scientific research innovation and achievement transformation in the field of environment is not high.

The “last mile” has not yet been effectively opened up.

(3) Opportunities facing ecological and environmental work during the 14th Five-Year Plan period.

The pace of ecological civilization construction has accelerated significantly.

The CPC Central Committee with Xi Jinping as the core has incorporated ecological civilization construction into the overall layout of “five in one” and

The “Four Comprehensives” strategic layout has comprehensively strengthened the construction of ecological civilization and carried out a series of

Sichuan continues to promote ecological civilization construction at a high level.

The Sichuan Provincial Committee of the Communist Party of China issued the "Notice on Promoting Green Development with the Achievement of Carbon Peak and Carbon Neutrality Goals"

A series of documents, including the Decision on the High-quality Development of the Low-carbon Advantageous Industries in the Province, have put forward

“One place and three regions” (i.e. the country’s important source of advanced green and low-carbon technology innovation, green

Concentrated bearing area of low-carbon advantageous industries, strategic support area for achieving carbon peak and carbon neutrality goals,

The development positioning of the Green Development Pilot Zone is to coexist harmoniously with nature.

Machine Translated by Google

With the new tasks and requirements, the process of ecological civilization construction in our province will surely be further accelerated.

The national development strategy brings new opportunities for ecological environmental protection. Sichuan is the Yangtze River and the Yellow River.

The upstream important water conservation area and ecological construction core area. Carbon peak and carbon neutrality, Yangtze River economic

Economic belt development, ecological protection and high-quality development of the Yellow River Basin, a new round of western development,

National strategies such as the construction of the Chengdu-Chongqing Twin Cities Economic Circle have made ecological and environmental protection an important

Task, ecological environment protection has become an important intersection of many national strategies, which will surely promote

Our province's ecological environment protection work has made greater breakthroughs, and at the same time, it will also contribute to our province's economic and social development.

It provides strong support for green and sustainable development.

The construction of beautiful Sichuan is accelerating. Building a beautiful Sichuan is the common wish of the people of the province.

After years of hard work, the construction of beautiful Sichuan has laid a good foundation and achieved remarkable results.

The construction of a high-quality livable place has further injected new impetus into the construction of a beautiful Sichuan.

At the same time, with the in-depth promotion of the construction of beautiful Sichuan, the party committee, government, enterprises, and the public

The pattern of social co-governance with extensive participation in ecological and environmental protection will be formed faster, which will surely bring

Accelerate the solution of current environmental problems and create favorable conditions for better ecological environmental protection

The work lays a broad social foundation.

(4) Challenges facing ecological and environmental work during the 14th Five-Year Plan period.

The instability and uncertainty of the internal and external environment have increased significantly, making it difficult to coordinate development and protection.

During the 14th Five-Year Plan period, the province's development and protection are unbalanced and insufficient.

It is still relatively prominent. The central and provincial ecological environment protection inspections have found some problems and rectified them.

The results of air and water environment governance are not stable, and there are problems in environmental infrastructure construction.

Shortcomings: some places have gaps in implementing the concept of green development, and the level of environmental protection law enforcement and supervision is not good.

The province's green development transformation, carbon peak target, and in-depth

Machine Translated by Google

The battle against pollution and other tasks have brought severe challenges.

The marginal diminishing effect of pollution control is gradually emerging, and the space for improving environmental quality is gradually decreasing.

During the 14th Five-Year Plan period, pollution control work will enter a deep water zone, and industrial structure, energy

The adjustment of structure, transportation structure, land use structure and social life related to food, clothing, housing,

Changes in behavioral habits such as walking and walking will gradually become the focus of ecological environmental protection work.

These adjustments and changes take a long time, involve many issues of understanding and practice, and are difficult to resolve.

The difficulty of continuously and stably improving the quality of the dynamic environment has also increased.

New environmental problems continue to emerge, and traditional governance technologies and methods are facing new challenges.

During the 14th Five-Year Plan period, the situation of biodiversity protection remains severe, and agricultural non-point source pollution

Pollution is still prominent, ozone pollution is becoming increasingly prominent, the task of reaching the carbon peak is arduous, endocrine disruptors,

The types of new pollutants such as perfluorinated compounds and microplastics are increasing, and traditional treatment technologies are

Governance methods are increasingly unable to meet the requirements of ecological and environmental protection in the new era.

II. General requirements

1. Guiding ideology

Guided by Xi Jinping Thought on Socialism with Chinese Characteristics for a New Era, we will fully implement the

The spirit of the 19th National Congress and the 19th Plenary Sessions of the 19th CPC Central Committee, and the in-depth implementation of Xi Jinping's ecological civilization thought

and General Secretary Xi Jinping's important instructions on Sichuan's work, and fully implement the Provincial Party Committee's

The spirit of the 8th, 9th and 10th plenary sessions of the 1st session is based on the new development stage and is complete, accurate and comprehensive.

Implement the new development concept, actively integrate into and serve the new development pattern, and closely focus on "one work, multiple

The strategic deployment of "support" and the construction of "one place, three districts" strategic goal are to meet the growing needs of the people.

The fundamental purpose is to build a beautiful ecological environment in the upper reaches of the Yangtze River and the Yellow River.

The ecological security barrier is the main goal, in order to promote the high-quality development of economy and society and the ecological environment.

Machine Translated by Google

With high-level environmental protection as the main line and "coordinated efficiency of pollution reduction and carbon reduction" as the general grasp, we will achieve Peak carbon neutrality is incorporated into the overall layout of economic and social development and ecological civilization construction, and accelerated Comprehensively transform economic and social development into a green one, actively respond to climate change, and thoroughly fight pollution prevention To tackle tough problems, broaden the path of ecological value transformation, and accelerate the promotion of ecological environment governance system and Modernize governance capabilities, strive to write a beautiful Sichuan chapter of China, and start the comprehensive construction of a socialist market economy. It lays a solid foundation for Sichuan's new journey of socialist modernization.

(2) Basic principles

Ecological priority and green development. Maintain the strategic focus of ecological civilization construction and strengthen upstream awareness, put ecological environment protection and restoration in a more prominent position, and practice green and low-carbon development development concept, give full play to the optimization and adjustment role of ecological environment protection in economic and social development, Accelerate the formation of a green and low-carbon production and lifestyle.

Systematic governance and precise policy implementation. Adhere to the principle that mountains, rivers, forests, fields, lakes, grasses and ice are a community of life. concept, comprehensively promote environmental pollution control and ecological protection and restoration, adhere to systematic governance, source We will continue to improve the overall governance and comprehensive governance, focus on precise pollution control, scientific pollution control, and pollution control in accordance with the law. The people’s sense of gain, happiness and security.

Regional coordination, joint prevention and control. Adhere to problem-oriented, goal-oriented, and result-oriented Establish and improve the ecological environment cooperation mechanism, strengthen overall planning, division of labor and cooperation, and complement each other's strengths to solve Solve systemic, regional and river basin ecological and environmental problems and promote regional green coordination develop.

Reform and innovation, improve the system. Accelerate the construction of a system led by the Party committee, dominated by the government and dominated by enterprises. modern environmental governance system with joint participation of the government and the public, strengthening economic and legal means, and deepening We will promote innovation-driven development, vigorously implement smart and information-based environmental protection, and comprehensively improve

Machine Translated by Google

Improve the modernization level of environmental governance system and governance capabilities.

(3) Target indicators

During the 14th Five-Year Plan period, a green and low-carbon production and lifestyle will be basically formed, and environmental governance The effect has been significantly enhanced, and the environmental quality of air, water and soil has continued to improve, further building a solid foundation for long-term development. The ecological security barrier of the upper reaches of the Yellow River, a national green development demonstration zone, and a high-quality livable area The land has been basically completed, and the construction of beautiful Sichuan has made significant progress.

——Green transformation has achieved remarkable results. The land space development and protection pattern is constantly optimized, The industrial structure is more optimized, the allocation of energy resources is more reasonable, and the utilization efficiency is greatly improved. Green transportation patterns are further optimized, green production and lifestyles are widely promoted, and carbon emissions are strong. The degree continues to decrease.

———The ecological environment continues to improve. The total amount of major pollutants discharged continues to decrease. By 2025, we will strive to achieve environmental quality in 21 cities (prefectures) and 183 counties (cities, The air quality in all regions has reached the standard, heavy pollution weather has been basically eliminated, and the water quality of the national controlled sections in the province has reached the standard. Mainly Class II, the water quality of the mainstream of the Yangtze River and the Yellow River has steadily reached Class II.

———Ecosystem service functions continue to increase. The upper reaches of the Yangtze River and the Yellow River are ecologically safe. The protection is more solid, and the national and provincial key protected species and Sichuan endemic species are effectively protected. The ecosystem of mountains, rivers, forests, fields, lakes, grasses and ice is integrated to achieve a virtuous cycle, and the quality of the ecosystem is improved. The quantity and stability are constantly improving.

———Environmental safety and effective control. Soil pollution has been basically controlled, and the soil environment The overall quality remains stable, the capacity for hazardous waste disposal and utilization is fully guaranteed, and nuclear safety supervision Continue to strengthen, the environmental emergency response system is constantly improving, the environmental emergency response capacity is continuously improving, and the environmental Risks are effectively controlled.

Machine Translated by Google

———The modernization level of environmental governance system and governance capacity has reached a new level.

The reform of civilized system and mechanism is being deepened, and the pace of digitalization and intelligentization of ecological environment supervision is accelerating.

Fast, the efficiency of ecological and environmental governance has been significantly improved, and the environmental governance system and governance capabilities have been modernized.

The level is at the leading level in the West.

Column 1 Sichuan Province's "14th Five-Year Plan" Ecological and Environmental Protection Planning Indicator System

index	Five-year cumulative indicator attributes from 2020 to 2025			
1. Environmental governance				
(1) Fine particulate matter (PM2.5) concentration (ÿg/m^3)	32	29ÿ 5		Constraints
(2) Ratio of days with good air quality in cities at prefecture level and above (%)	90ÿ 7	92ÿ 0		Constraints
(3) Ratio of days with severe air pollution in cities at prefecture level and above (%)	0ÿ 16	0ÿ 1		Constraints
(4) Proportion of surface water quality in national test sections that reaches or exceeds Class III water quality (%)	93	97ÿ 5		Constraints
(5) Proportion of surface water quality inferior to Class V (%)	0ÿ 0	0ÿ 0		Constraints
(6) Proportion of black and odorous water bodies in built-up areas of cities at or above prefecture level (%)	/	Completed Country Issue target		Constraints
(7) Ratio of groundwater quality class V (%)	/	Completed Country Issue target		Constraints
(8) Proportion of administrative villages with effective treatment of rural domestic sewage (%)	58ÿ 37	75		Anticipation
(9) Nitrogen oxide emission reduction by key projects (10,000 tons)	— — 5.95 Binding			
(10) Emission reduction of volatile organic compounds from key projects (10,000 tons)	— — 2.53 Binding			
(11) Chemical oxygen demand reduction by key projects (10,000 tons)	— — 14.92 Binding			
(12) Ammonia nitrogen emission reduction from key projects (10,000 tons)	— — 0.79 Binding			
2. Addressing climate change				
(13) Reduction in carbon dioxide emissions per unit of GDP (%)	--		Completed Country Issue target	Constraints
(14) Reduction in energy consumption per unit of GDP (%)	--		Completed Country Issue target	Constraints
(15) Non-fossil energy as a percentage of total energy consumption (%)	— — 42 Anticipation			
3. Environmental risk prevention and control				
(16) Safe utilization rate of polluted cultivated land (%)	/	93		Constraints
(17) Safe use of key construction land	/	Completed Country Issue target		Constraints

index	Five-year cumulative indicator attributes from 2020 to 2025			
(IV) Ecological Protection				
(18) Ecological Quality Index (EQI)	/ Stable and improving			Anticipation
(19) Forest coverage rate (%)	40	43		Constraints
(20) Proportion of ecological protection red line to land area (%)	30ÿ 45	No reduction in area Few, functional No decline, sex Quality unchanged		Constraints

Looking forward to 2035, green production and lifestyle will be widely formed, and carbon dioxide emissions will reach After the peak, the ecological environment has become more beautiful, and the environmental quality has fundamentally improved. The upstream ecological security barrier is more solid, and the ecological environment governance system and governance capacity are modernized. The modernization of Sichuan has been basically realized, and the beautiful picture of Sichuan has been basically painted.

3. Promote the comprehensive green and low-carbon transformation of the economy and society and build a national green development demonstration Fan District

Implement the new development concept and give full play to the guidance, optimization and promotion of ecological environment protection role, accelerate the construction of green space pattern, promote production methods, energy utilization, and lifestyle And other green transformations to achieve high-quality economic and social development.

(1) Build a green space pattern.

Strengthen the spatial zoning control of the ecological environment. Deeply implement the main functional area strategy and build Build a new pattern of land space development and protection, forming a safe and efficient production space, a comfortable and livable The comprehensive implementation of the “Three Lines and One List” as the core The ecological environment zoning control system is established to combine dynamic update with regular adjustment. Update adjustment mechanism. Promote the establishment of “three lines and one list” ecological environment zoning control tracking and evaluation Strengthen the ecological environment spatial zoning control in policy

Machine Translated by Google

Application in formulation, environmental assessment and approval, park management, law enforcement and supervision.

The total amount control and intensity control are integrated into the “three lines and one list” ecological environment zoning control system.

By 2025, a relatively complete ecological environment

Environmental zoning management and control system and data application system.

Promote green and coordinated development in the five major regions. Give full play to the comparative advantages of different regions.

Comprehensively promote the coordinated development of the "five districts" and green development. Chengdu Plain area is gradually relieved

Urban non-core industrial functions, accelerate industrial upgrading, and build a high-quality development leading area

As a pilot zone for a park city, it is at the forefront of the province in terms of improving the quality of the ecological environment.

Southern Sichuan is accelerating the optimization of its industrial structure, orderly undertaking industrial transfer, and promoting high-quality resource and energy

The northeastern Sichuan region is accelerating the promotion of steel

Green transformation of traditional industries such as iron, building materials, natural gas and chemical industry, comprehensively promoting rural revitalization,

The Panxi region promotes the comprehensive development of Anning River Valley.

Comprehensive development, strengthen ecological restoration, enhance the green supply capacity of energy resources, and accelerate the development of modern

Agricultural demonstration base, national strategic resource innovation and development pilot zone, national important clean energy

The northwest region of Sichuan Province adheres to the principle of ecological priority and enhances the function of ecological security barrier.

We will vigorously develop the ecological economy and build a national demonstration zone for ecological civilization construction.

Guide the construction of an industrial spatial layout that is compatible with the ecological environment. Reasonable planning and layout

Key industries, taking resource and environmental carrying capacity, environmental risk acceptability, etc. as the

Support the existing steel, cement, coking and other industries with large waste gas emissions

The industry is shifting to areas with rigid demand, resource advantages and environmental capacity.

Support existing high water consumption industries such as papermaking, textile printing and dyeing, electroplating, brewing, etc. to move towards water resources

Machine Translated by Google

The transfer layout should be carried out in areas with abundant water resources, sufficient water environment capacity and complete infrastructure.

High-energy-consuming industries that require environmental protection, energy efficiency and other standards are concentrated in areas with clean energy advantages.

Guide high-energy-consuming and high-emission enterprises to relocate, transform and move out of the city and into industrial parks. Promote the Yangtze River Economic Belt

Optimize industrial layout and promote green transformation and development. Prohibit the construction of new buildings within one kilometer of the Yangtze River and its tributaries.

New construction and expansion of chemical parks and chemical projects within the Yellow River Basin.

The district prohibits the construction of new buildings that have a serious impact on the ecosystem, such as high water consumption, high pollution or high energy consumption

project.

(2) Promote green transformation of production methods.

Promote the withdrawal of obsolete production capacity. Strictly control the construction of new (renovation, expansion) high energy consumption and high emission

Projects, new high-energy-consuming and high-emission projects should implement regional reductions in accordance with relevant requirements.

Implement capacity replacement policies in industries such as steel, cement, flat glass, and electrolytic aluminum.

The post-capacity exit mechanism will be implemented for energy consumption, environmental protection, safety, technology that does not meet the standards, and production that does not meet the standards.

Enterprises and production capacities that produce obsolete or outdated products shall be closed down and eliminated in accordance with the law, and heavy polluting enterprises shall be promoted.

The industry shall be relocated to the park or closed according to law.

For production enterprises with safety hazards, we will accelerate the promotion of on-site transformation, relocation and closure.

Develop differentiated environmental management and set the most stringent requirements for energy consumption, material consumption, pollutant emissions and other indicators.

Control requirements will force production capacity with insufficient competitiveness to withdraw.

Promote green transformation of traditional industries. Comprehensively promote the steel, chemical, metallurgy, building materials,

Enterprises in traditional fields such as light industry and food should implement clean, circular and low-carbon development in all factors and processes.

Carbonization transformation, integrating intelligence and green into the R&D, design, production and sales process,

Improve resource and energy utilization efficiency and effectively reduce pollutant emissions. Actively build green production

Machine Translated by Google

Focusing on industries such as steel, papermaking, and food, we will promote green products,

Low-carbon upgrades will increase the supply capacity of green products and increase their market share.

The provincial clean production audit implementation measures implement mandatory audits in the "double-overload, double-hazard, high-energy-consuming" industries

Clean production audit. By 2025, the province's steel, cement, electrolytic aluminum, liquor, papermaking, etc.

The clean production level of industry enterprises has reached the domestic advanced level.

Promote the green transformation of development zones. Promote the integration of traditional industrial clusters and development zones.

Improve the green level. Continue to promote the circular transformation of the park and reasonably extend the industrial chain.

Promote the formation of industrial cycle coupling, promote the effective use of waste, waste heat, waste pressure, waste water, etc. among enterprises

By 2025, 75% of national parks and 50% of provincial parks will have completed recycling.

Promote green transformation of park infrastructure and explore environmental governance such as “green islands”

Management model, encourage the construction of shared environmental protection public infrastructure or centralized process facilities in the park.

Encourage the construction of industrial green and low-carbon microgrids. Promote the construction of green and low-carbon development zones.

Encourage provincial and above development zones to prepare near-zero carbon emission plans and promote construction

A number of near-zero carbon emission development zones. Promote the green development of China (Sichuan) Free Trade Pilot Zone

Explore pilot projects for cleaner production audits in industries, development zones and enterprise clusters.

Vigorously develop green environmental protection industries. Support new energy, power batteries, and new energy vehicles

The high-quality development of green and low-carbon advantageous industries such as automobiles and big data will strive to create a nationally influential

Green and low-carbon advantageous industrial clusters with great influence and support for Sichuan’s development.

Industrialization and localization of major technical equipment in the environmental protection industry, promoting the integration of energy-saving and environmental protection industries with 5G,

The Internet of Things, artificial intelligence and other industries are deeply integrated to promote industrial upgrading. Support the environmental protection industry

Integrate upstream and downstream supply chains and actively develop environmental service complexes. Support labor-intensive environmental protection

Machine Translated by Google

The industry will develop healthily. Accelerate the cultivation of environmental protection industry clusters through attracting investment and talents, mergers and reorganizations.

Accelerate the green transformation of the information service industry and promote data

Center and other new infrastructure construction and renovation, and establish a green operation and maintenance system.

The construction of Chengdu Plain area focuses on environmental protection technology research and development, environmental protection equipment manufacturing, energy conservation and environmental protection, etc.

The characteristic environmental protection industrial base, Panxi and southern Sichuan regions are built with the characteristics of comprehensive resource utilization

Environmental protection industry base.

Build green agriculture in all aspects. Vigorously develop green low-carbon circular agriculture and build green

green, modern and efficient agricultural inputs, production methods and recycling systems, and support areas with conditions to

The district has launched the construction of a national agricultural green development pilot zone and promoted the use of water-saving irrigation technology.

Promote the reduction of fertilizers and pesticides, and promote healthy aquaculture models.

Develop high-standard large-scale ecological breeding and accelerate the promotion of green breeding and circular agriculture.

The system for harmless disposal of dead livestock and poultry is prohibited. The production, sale and use of

Agricultural films that do not meet mandatory national standards are encouraged and supported to produce and use fully biodegradable

Agricultural film. Promote the comprehensive utilization of straw in the county as a whole, and encourage the cross-regional industrialization of straw

By 2025, a relatively complete straw collection, storage and utilization system will be established.

The utilization rate is maintained at above 90%. Based on the resource advantages, we will create agricultural products with unique characteristics.

industrial chain, and promote the low-carbon, coordinated and integrated development of the primary, secondary and tertiary industries in rural areas.

Build a modern green transportation system. Support the construction of a high-speed railway and intercity railway

The main large-capacity rapid passenger transport system will gradually reduce the volume of road passenger transport.

The green transformation of the transportation mode is encouraged, and the transportation of bulk goods from road to rail and from road to water is significantly improved.

The proportion of green transportation modes for goods. Promote the construction of multimodal transport projects such as rail-water, road-rail, and road-water.

Machine Translated by Google

To build a high-capacity and efficient freight channel along the river, and accelerate the integration of inland waterway shipping, ports, and cargo transportation.

By 2025, the annual transportation volume of bulk cargo will reach 150

The proportion of large industrial and mining enterprises with a capacity of more than 10,000 tons and new logistics parks with dedicated railway lines

Strive to reach 85%. Promote the implementation of green and intelligent transformation projects in airports and accelerate the key watersheds

Construction of port shore power facilities and transformation of ship shore power facilities. Support the application of LNG in the Yangtze River trunk line

(liquefied natural gas) powered ships, Luzhou Port and Yibin Port on the main stream of the Yangtze River have basically achieved iron

Road access to the port. Promote the urban green freight distribution demonstration project. Support the low-carbon development of logistics parks.

Environmental and green construction.

(3) Promote green transformation in energy utilization methods.

Optimize the energy supply structure. Accelerate the construction of a national clean energy demonstration province.

Develop hydropower in an orderly manner, accelerate the development of wind power and solar power generation, and promote the integration of hydropower with wind power and solar power.

Solar power generation is complementary. Coordinated promotion of the upper reaches of the Jinsha River, the lower reaches of the Jinsha River, and the Yalong River

The wind, solar and water integrated renewable energy integrated development focuses on the middle and upper reaches of the Dadu River Basin

Development base construction. Accelerate the development of distributed renewable energy. Promote biomass

The development of clean energy such as biogas, biogas power generation and biogas.

Gas-fired power generation projects to meet the needs of power grid support. Strengthen the construction of power system regulation capabilities

and flexibility transformation, optimize the layout of transmission channels, and improve the clean energy consumption and storage capacity.

Build hydrogen energy facilities in an orderly manner and accelerate the construction of Chengdu-Chongqing

Hydrogen corridor and Chengdu hydrogen energy industry ecosystem, carry out hydrogen energy technology research and promote hydrogen production industry

By 2025, the installed capacity of photovoltaic and wind power generation will reach 10 million kilowatts each.

In 2016, the proportion of non-fossil energy consumption reached about 42%.

Machine Translated by Google

Promote the green development of the national natural gas (shale gas) production base with a capacity of 100 billion cubic meters

Accelerate the construction of natural gas pipelines and storage facilities.

Focus on gas fields such as high-sulfur natural gas, tight gas in western Sichuan, and shale gas in southern Sichuan, and strengthen gas fields.

Environmental management of development, promoting methane emission reduction and recycling, improving waste oil-based mud,

Oil-containing drill cuttings and other drilling wastes can be used as resources and safely disposed of to strengthen groundwater pollution prevention and control.

Pollution prevention and control, and pay attention to environmental risk control during wastewater reinjection.

Research and application of technologies such as clean air development and pollution control, and accelerate the formulation of regional

Environmental policies, standards and pollution prevention and control technical specifications for unconventional natural gas extraction.

Promote the comprehensive utilization of natural gas resources and support the high-quality development of green natural gas production areas.

Fine chemical industry.

Control the total amount of coal consumption. Promote coal reduction and substitution. Orderly eliminate backward coal-fired power

In principle, no new self-owned coal-fired units will be added, and self-owned coal-fired units will be supported to implement clean

Energy substitution, accelerate the energy-saving upgrade and flexibility transformation of existing coal-fired power units.

Clean and efficient use of fossil energy such as coal. Promote green and low-carbon transformation of coal chemical enterprises, strengthen

Environmental protection and comprehensive utilization of resources. Strengthen the comprehensive utilization of coalbed methane (coal mine gas).

Encourage the application of alternative energy such as hydrogen and biofuels in the steel, cement, chemical and other industries.

Improve the level of electrification of industrial terminal energy consumption and strengthen the utilization of industrial waste heat.

The construction of natural gas pipelines, power grids and other facilities will effectively ensure the replacement of coal with gas and coal with electricity.

Project. By 2025, the province's coal consumption will reach its peak.

(4) Promote green transformation of lifestyles.

Improve green consumption policies. Formulate fiscal incentives for green consumption. Explore and implement

Machine Translated by Google

The green consumption points system creates green consumption scenarios and encourages the consumption of green and low-carbon products.

Implement the "Electric Sichuan" action plan, improve new energy vehicle consumption policies, and promote public

Institutions take the lead in using new energy vehicles. Improve the green and low-carbon product standard system and enhance green

Give full play to the leading role of standards and certification

Improve the effective supply of green products. Strictly implement the government's preferential policies for energy-saving and environmentally friendly products.

Priority procurement and mandatory procurement systems, expand the scope of government green procurement, improve the standard system and

Implementation mechanism to increase the scale of government green procurement.

Carry out green life creation. Advocate the concept of green life and guide the public to form low-carbon

A frugal lifestyle. Promote the "Clean Plate" campaign and encourage restaurants to use biodegradable packaging.

Limit the use of disposable items in restaurants, hotels, shops, etc. Promote public transportation, bicycles,

Strengthen environmental awareness and encourage individuals and families to develop green travel methods such as driving and walking.

Improve the habit of recycling resources and consciously sort garbage. Regulate new industries such as express delivery and sharing economy

Promote environmentally friendly business practices and limit excessive packaging of goods. Promote demonstration of green freight distribution in cities

Vigorously promote green buildings and encourage the use of green household appliances such as energy-saving and water-saving.

Deepen the green living creation campaign.

Accelerate the construction of green living supporting facilities. Build convenient and fast urban public transportation

network system, strengthen the effective connection between travel parking and public transportation, and improve urban walking and cycling

Traffic system construction. Public parking areas, residential areas, highway service areas, etc.

Focus on accelerating the construction of electric vehicle charging piles, battery swap stations and other facilities, and basically form an electric

Car charging network system. Promote green community infrastructure and improve water, electricity, gas, roads, etc.

Supporting infrastructure, use energy-saving lighting and water-saving devices, and rationally plan and build public green spaces.

Machine Translated by Google

Explore the establishment of a waste recycling facility system with a reasonable layout and standardized management.

The technical standards for waste sorting will be improved, and the standardized construction of waste sorting facilities will be accelerated.

The share of motorized travel by public transport in cities with a permanent urban population of more than 1 million is not

Less than 65%; For cities with a permanent urban population of 1 million or less, establish a ground public transportation backbone

Main passages are built to create a superior walking and cycling environment according to local conditions.

Column 2: Major low-carbon green projects

(I) Green transformation and upgrading projects for key industries and parks

Comprehensively promote clean, circular, and low-carbon transformation of enterprises in traditional fields such as steel, chemical, light industry, metallurgy, building materials, and food. Implement circular and green transformation of development zones such as Guang'an Xinqiao Chemical Park, Guangyuan Economic and Technological Development Zone, Dazhou Economic and Technological Development Zone, and Panzhihua Vanadium Titanium High-tech Zone (Vanadium Titanium New City). Promote the construction of circular parks such as Chang'an Venous Industrial Park, Zigong Circular Economy Industrial Park, Luzhou Yangtze River Economic Development Zone Circular Economy Industrial Park, and Yibin Resource Recycling Base. Accelerate the construction of green industry demonstration bases such as Zigong High-tech Industrial Development Zone.

(II) Green agricultural projects Implement

agricultural water-saving projects in large and medium-sized irrigation areas such as Dujiangyan, Yuxi River, and Qianjin Canal. Focus on 100 counties that are strategic bases for commercial pigs and implement standardized transformation and construction projects for large-scale livestock and poultry farms (communities). Focus on the Chengdu Plain and the hilly areas in southern and northeastern Sichuan to build a number of straw comprehensive utilization projects to promote the use of straw resources as fertilizer, fuel, raw materials, feed, and base materials. Promote the construction of national agricultural green development pilot areas such as Chengdu Qingbaijiang District, Zigong Rong County, and Luzhou Lu County.

(III) Modern green transportation projects Promote

the expansion and upgrading of the Yangtze River main line, and orderly implement the cascade construction and channel regulation of the Jialing River, Min River and Qu River. Carry out the demonstration construction of the Minjiang River green ecological waterway. Implement the Luzhou and Yibin LNG refueling terminal projects. Promote the multimodal transport demonstration projects such as Chengdu Tianfu International Airport "Air-Rail-Road", Chengdu International Railway Port, and China Western Automobile Logistics.

(IV) Clean

energy and energy-saving projects Promote the

construction of wind, solar and water integrated renewable energy comprehensive development bases in Panzhihua, Ganzi, Aba, Liangshan and other places. Promote the construction of the "Three Rivers" hydropower base of Jinsha River, Yalong River and Dadu River. Promote the development of distributed wind and solar energy, and encourage the orderly construction of wind power projects in the basin-surrounding mountainous areas and western Sichuan. Implement energy-saving upgrading and transformation projects for coal chemical enterprises in Panzhihua, Luzhou, Neijiang and other places. Promote the intelligent transformation of large and medium-sized coal mines.

IV. Actively respond to climate change and build a low-carbon development highland in the western region

Launch the action plan to reach the peak of carbon dioxide emissions and carry out low-carbon development pilot demonstrations.

Machine Translated by Google

Adapt to climate change in an orderly manner, coordinate efforts to reduce pollution and carbon emissions, and protect and restore the ecosystem, and promote efforts to address climate change

Climate change work has reached a new level.

(1) Accelerate the implementation of carbon emissions peak action.

Organize and carry out carbon emission peak action. Scientifically analyze the future carbon emission trend and carry out

Study the timetable, roadmap and construction plan for the peak of carbon dioxide emissions, and promote key areas,

Key areas and key enterprises proposed overall goals for carbon dioxide emissions peaking and phased tasks.

Adhere to the overall situation of the province, adjust and optimize the industrial structure,

Energy structure, transportation structure, and land use structure, actively explore the strategic positioning and development stage

The green and low-carbon transformation path based on the stage, industrial characteristics, energy structure and resource endowment will continue to reduce

In accordance with national deployment requirements, accelerate the establishment of a unified and standardized carbon emission intensity in the province.

Emissions statistical accounting system, explore the implementation of carbon intensity control and total carbon emissions control

A supporting system will lay a solid foundation for reaching carbon peak.

Gradually strengthen carbon emission control in key areas. Carry out carbon emission control in key industries and key areas.

Peak and carbon neutrality basic research, scientific compilation of energy, industry, urban and rural construction, transportation and agriculture

Carbon peak plans for key industries and key areas such as agriculture and rural areas. Steadily promote fuel substitution,

Material substitution, total quantity control, structural optimization, energy efficiency improvement, technological innovation, digital empowerment, management

Improve efficiency, etc. Promote green and low-carbon development of industry in all directions, all regions and all cycles.

Mobilize key industries such as steel, nonferrous metals, building materials, and chemicals to formulate peak action plans.

Some enterprises play a leading and exemplary role, study and formulate special action plans, and optimize investment structure

and industrial layout, and gradually reduce the carbon dioxide emissions per unit product. Support qualified

Key industries and key enterprises will take the lead in reaching carbon emission peaks, and cities and

The park participates in the national carbon peak pilot construction.

Machine Translated by Google

Promote differentiated control of regional carbon emissions.

Development zones, national sustainable development experimental zones, national ecological industrial demonstration parks, etc.

As the key area, we will focus on industrial optimization, energy adjustment, circular development, technological innovation, platform construction

The project demonstration is the key task, and a carbon peak action plan is formulated to clearly define pollution reduction and carbon reduction.

Encourage Chengdu and Guangyuan to build national low-carbon

Demonstration cities are encouraged to explore paths to build carbon neutral pilot zones in Sichuan Province with conditions.

(2) Effectively control greenhouse gas emissions.

Steadily reduce carbon dioxide emission intensity. Orderly carry out vanadium titanium steel, building materials, stone

Green, circular and low-carbon transformation of industries such as chemical and thermal power, and control of the second

carbon dioxide emissions, accelerate the development of electric arc furnace short-process steelmaking, explore the development of cement, steel, and chemical

Encourage carbon capture, utilization and storage, hydrogen metallurgy and other frontier industries to replace raw materials and fuels.

Actively participate in the national carbon emission rights trading and improve corporate carbon emissions

and carbon asset management capabilities. Vigorously promote new energy vehicles and strengthen

By 2025, the carbon dioxide emissions per unit of transport turnover of operating vehicles and ships will be

Promote green buildings and prefabricated buildings, and promote renewable energy

Energy-saving building applications, promote green transformation of existing buildings, and lead the way in ultra-low energy consumption buildings and zero-carbon buildings.

By 2025, all new urban buildings will comply with green building standards.

Control non-CO2 greenhouse gas emissions. Improve greenhouse gas emission statistics and accounting

system, regularly compile provincial, municipal (state) greenhouse gas inventories, and conduct national carbon monitoring tests

Explore the implementation of methane emission control actions and carry out methane emission reduction research in the process of fossil energy development.

Leak detection and repair to reduce methane emissions during natural gas (shale gas) exploration and development

Encourage the implementation of oxygen in the nitric acid production process.

Machine Translated by Google

Nitrous oxide emission reduction project, supporting the stable operation of chlorodifluoromethane production line, trifluoromethane

alkane destruction device, promote the reduction technology of perfluorocarbons in the aluminum electrolysis production process, strengthen the power

Equipment for the recovery, treatment and reuse of sulfur hexafluoride. Control of methane and oxygen in farmland and livestock and poultry breeding

Reduce nitrous oxide emissions, strengthen sewage treatment and landfill methane emission control and recycling.

Improve the carbon sequestration capacity of ecosystems. Accelerate the construction of forests, grasslands, wetlands and other ecosystems.

The carbon sink monitoring network of the ecosystem is used to evaluate the carbon sinks in forests, grasslands, wetlands, soils, frozen soils, farmlands, etc.

The role of ecosystem activities in reducing carbon emissions and increasing carbon sinks.

We will strengthen the Yangtze River corridor, the Yellow River upstream water conservation area, and the Qin

Greening of the Bashan area, Wumeng mountain area, and river sources, and strengthening of desertification, dry and hot river valleys, and rocky areas.

Ecological restoration of fragile areas such as desertification, organically integrating the natural ecology of mountains, rivers, forests, fields, lakes, grasses and sand ice

Strictly implement the basic grassland protection system such as grazing ban, rest grazing, rotational grazing, and grass-livestock balance.

Scientifically conserve the peatlands in northwest Sichuan. Improve the development mechanism of forest and grass carbon sink projects and explore the

and herdsmen to realize the value of small-scale forest and grassland resources, develop rural forest and grassland carbon sink products, and promote

Enter into forest and grassland carbon sink trading and absorption.

(3) Adapt to the impacts of climate change in an orderly manner.

Carry out climate change risk monitoring and assessment. Carry out climate change observation and greenhouse gas

Background concentration monitoring, establishing a long-series historical climate database.

Focus on the ecological system to carry out the layout and construction of the climate monitoring network. Promote participation in the Qinghai-Tibet Plateau Comprehensive

Scientific investigation and research to strengthen the impact of global warming on the Giant Panda National Park and the Northwest Sichuan Peatland

areas with fragile bearing capacity, such as dry and hot valleys, areas along the Sichuan-Tibet Railway, and low-lying areas along the river in basins.

Observation and assessment of the impact on ecologically fragile areas, ecological barrier areas, and marginal transition areas.

The sensitivity and vulnerability of key economic zones to climate change and extreme weather and climate events

Machine Translated by Google

Weakness, carry out research on the impact of climate change and extreme weather events on energy, water conservancy, industry, construction

Impact assessment of key industries and key areas such as construction, transportation, ecological environment and human health

Research and evaluate the construction and operation risks of major projects brought about by extreme weather and climate.

Actively respond to extreme weather and climate events. Strengthen high temperature heat waves, persistent droughts, extreme

Monitoring, early warning and forecasting of extreme weather and climate events such as heavy rains and low temperatures and frost damage and the disasters they induce

Improve the wind and rain resistance of power transmission and transformation facilities, and improve the disaster risk zoning and emergency response plans.

The emergency plan for pressure relief and anti-freezing is in place to strengthen the power supply guarantee and peak load regulation during the summer and winter power consumption peaks.

capacity, and accelerate the layout of pumped storage and clean peak-shaving projects. Actively respond to the heat island effect and urban

Urban waterlogging, building sponge cities and integrated pipeline corridors. By 2025, we will strive to

More than 50% of the area meets the requirements for sponge city construction. Strengthen extreme weather and climate health risk management

Monitor and warn of dangerous and epidemic diseases to improve the protection capabilities of vulnerable groups.

Gradually improve the adaptive capacity of key areas. Pilot climate feasibility studies for major projects

Explore low-impact urban development in accordance with local conditions

models, promote the application of climate-friendly technologies, and build climate-adaptive cities.

and natural heritage protection, and improve disaster prevention capabilities. Adjust and optimize the structure of crop varieties,

Cultivate and promote crop varieties with high light efficiency, high temperature resistance, drought resistance and stress resistance.

The trend is to gradually adjust the crop variety layout and planting system, and moderately increase the multiple cropping index.

Reasonably adjust and configure afforestation tree species and forest types according to changes in temperature and precipitation, increase fire resistance and

The proportion of tree species that are drought (wet), resistant to pests and diseases, and resistant to extreme temperatures should be properly allocated to afforestation species and afforestation

forest density, optimize forest structure, increase the proportion of native tree species and mixed forests, and improve forest grassland

The original fire monitoring and reporting system.

(4) Strengthen support for responding to climate change.

Machine Translated by Google

Explore low-carbon pilot demonstration paths.

Focusing on low-carbon transportation and low-carbon lifestyle, we selected

In resource-rich areas, explore low-carbon city (state), county (city, district) construction paths according to local conditions.

According to the three paths of reducing sources, increasing sinks and substitution, pilot projects of near-zero carbon emission zones will be carried out.

Support key cities to strive for air quality standards and carbon emissions peak "double achievement" pilot demonstration, promote

Promote the coordinated pollution reduction and carbon reduction pilot projects in energy, steel, building materials, chemicals, transportation and other industries.

Greenhouse gas emissions and

Pilot projects for the connection of pollutant discharge permit management. Support qualified regions to apply for national climate action

Pilot demonstrations on changes in investment and financing, coordinated pollution and carbon reduction, and adaptation to climate change.

Implement carbon asset capacity enhancement actions. Study and formulate supporting policies for carbon emission trading management.

Strengthen the monitoring and accounting of greenhouse gas emissions, data reporting and verification of key emission units.

Conduct inspections, audits, quota allocations and compliance supervision, and standardize the entrusted management of carbon assets.

Voluntary greenhouse gas emission reduction trading activities for projects, and implementation of carbon emission rights trading offset mechanism

Explore and innovate a virtuous cycle of carbon credit mechanisms, strengthen the construction of a carbon credit support system,

Accelerate the construction of a low-carbon living circle that everyone participates in and everyone shares.

Focus on sports events, implement carbon neutrality for large-scale events, and enrich the public’s low-carbon lifestyle.

Lihe supports the China (Sichuan) Pilot Free Trade Zone to carry out low-carbon certification of export products,

Improve enterprises' ability to cope with new trade barriers and enhance the green competitiveness of export products.

Strengthen the leading support of science and technology. Build a high-end innovation platform to address climate change.

Build Tianfu Yongxing Laboratory and Carbon Neutral Technology Innovation Center. Strengthen the response to climate change

Basic research to promote research in the fields of climate change facts, driving mechanisms, and key feedback processes.

Accelerate the development of advanced solar power, wind power, new generation nuclear power, integrated fuel cell

Machine Translated by Google

batteries, smart grids, green hydrogen, new energy storage, lithium-ion batteries, vanadium batteries, shale gas development

Development of applicable and cutting-edge technologies such as clean and efficient mining and utilization of coal, and promoting the development of carbon dioxide

Capture, utilization and storage, medium and low temperature geothermal power generation, and efficient utilization of shallow geothermal energy

Promote digital technologies such as big data, blockchain, and cloud computing to empower the response to climate change

to improve the level of informatization, digitization and intelligence. Establish a system for the selection, demonstration and

Promotion mechanism to promote the industrialization development of low-carbon technologies.

Column 3 Major projects to address climate change

(I) Forest and Grassland Carbon Sink Project Development

Project Carry out a baseline survey of forest and grassland carbon sink resources, build a forest and grassland carbon sink project measurement system, support the demonstration of forest and grassland carbon sink projects such as Liangshan rural revitalization, Xuanhan forest management, Tianquan giant panda habitat restoration, Longquanshan urban forest construction, and Ruoergai wetland protection, and establish the brand image of Sichuan forest and grassland carbon sink. By 2025, strive to reach a total scale of 30 million mu of forest and grassland

carbon sink projects. (II) Climate Change Capacity Building Project

Implement corporate carbon asset capacity improvement actions and promote project-based voluntary greenhouse gas emission reduction trading activities. Develop a number of carbon benefit methodologies around public behavior emission reduction, forest and grassland carbon sink improvement, and urban and rural environmental improvement, and build a regional characteristic carbon benefit mechanism. Build a regional greenhouse gas inventory intelligent integration and management platform, implement the annual compilation of provincial inventories, the encrypted compilation of municipal (state) greenhouse gas inventories, and the accelerated compilation of county inventories. Focus on conferences, exhibitions, and events, and implement a number of large-scale event carbon neutrality demonstration projects. Focus on characteristic and advantageous areas, and accelerate the establishment and improvement of local standards for controlling greenhouse gas emissions.

V. Deepen coordinated control of air pollution and continuously improve ambient air quality

Adhere to source control and comprehensive measures, deepen industrial source, mobile source and surface source control, and assist

Same control for PM2.5 and ozone pollution, strengthen the coordinated control of multiple pollutants and regional coordinated governance

To give the people more "blue sky, white clouds and shining stars".

(1) Deepen the prevention and control of pollution from industrial sources.

Strengthen pollution control in key industries. Accelerate the reform of thermal power, steel, cement, coking and coal-fired power plants.

Ultra-low emission transformation of industrial boilers. Promote the development of heavy metals such as flat glass, ceramics, ferroalloys, and nonferrous metals.

Machine Translated by Google

Deepen the comprehensive governance of air pollution from industrial furnaces and kilns, and basically complete the

Replace highly polluting fuels with clean energy from industrial furnaces.

Coal-fired boilers with a capacity of 10 tons/hour or less will not be newly built in county-level and above urban built-up areas in principle.

Coal-fired boilers with a capacity of less than 35 tons of steam per hour, coal-fired boilers with a capacity of 65 tons of steam per hour and above (including

Electricity) fully realize ultra-low emission transformation and accelerate the low-nitrogen combustion transformation of gas boilers.

Promote the cancellation of unnecessary flue gas bypass in industries such as petrochemicals, flat glass, and building ceramics.

Strengthen the supervision of the operation of treatment facilities to ensure compliance with ultra-low emission limits and relevant standards

Operation, reduce abnormal operating conditions emissions. Continue to promote clean energy in cities and towns in northwest Sichuan

Heating. Strengthen the control of unorganized emissions in industries such as steel, cement, and mining.

Strengthen pollution control in development zones. Gradually promote “one park, one policy” waste gas control and complete

The waste gas treatment plan of "one park, one policy" should be prepared for parks at the provincial level and above.

Districts are encouraged to build centralized waste gas treatment facilities, dust suppression spraying engineering centers, centralized spraying plants

The park will promote centralized heating and support the development of

The gas-fired cogeneration project in the district is planned and constructed.

Establish and improve the park's atmospheric automatic monitoring and control system covering pollution sources and environmental quality,

Improve the level of atmospheric environment management in the park.

Control the emission of volatile organic compounds (VOCs). Strictly control the total amount of VOCs emissions.

New VOCs projects should implement equal or multiple replacement. Strengthen VOCs source reduction to

Focus on industries such as industrial coating, furniture manufacturing, packaging and printing, and vigorously promote low (no)

Replacement of raw and auxiliary materials with low VOCs content. Strictly control the production and use of solvents with high VOCs content

Construction projects for coatings, inks, adhesives, cleaning agents, etc. Strengthen comprehensive VOCs control,

Petrochemical, chemical, industrial coating, packaging and printing, electronics, textile printing and dyeing, shoemaking, furniture manufacturing

Machine Translated by Google

Focus on industries such as oil production, oil storage, transportation and sales, and improve the waste gas collection rate and the simultaneous operation of pollution control facilities.

Improve the efficiency and removal rate of the facility, scientifically and rationally select the treatment process, and promote the upgrading and improvement of facilities and equipment.

Strengthen the control of unorganized emissions, increase the storage, transfer and transportation of VOCs-containing materials,

Strengthen the control of equipment and pipeline component leakage, open liquid surface escape, etc., and carry out leak detection and

Repair work. Strengthen the supervision of VOCs emission compliance of enterprises and implement seasonal regulation.

Improve the volatile organic compound product standard system and establish a low volatile organic compound content product standard system.

Knowledge system.

(2) Promote pollution prevention and control from mobile sources.

Promote the upgrading and optimization of vehicles and ships. Promote the upgrading of standards for motor vehicles, ships and oil products.

We will vigorously promote the use of old vehicles through economic incentives, scientific demarcation of restricted areas, and strengthened supervision.

Vehicles and ships will be phased out and replaced ahead of schedule. By 2025, diesel trucks of National III standard and below will be basically phased out.

Encourage the Chengdu Plain area to eliminate diesel trucks with National IV and below standards, and basically eliminate those that do not meet the

Oil and gas recovery conditions for transport ships, encourage the early retirement of old inland vessels over 20 years old

Formulate differentiated policy measures to encourage the use of new energy vehicles and ships, and promote the use of new energy vehicles.

Development of new energy vehicles, promotion of new energy ships, and improvement of the use of new energy in ferries, tourist ships, and port ships.

By 2025, new energy vehicle sales will account for more than 20%.

New energy vehicles are widely used in urban public transportation, taxis, urban distribution, postal express, airports, railways, etc.

By 2025, clean cities at prefecture level and above will

The utilization rate of energy vehicles in the public domain has increased significantly, and urban buses in cities divided into districts are basically

Realize new energy.

Strictly manage the environmental protection of motor vehicles. Strengthen the supervision of the environmental protection of newly produced motor vehicles.

Strengthen the construction and application of information technology for motor vehicle emission monitoring. Accelerate the construction of national environmental protection

Machine Translated by Google

The key laboratory of motor vehicle pollution control and simulation is established.

Strengthen motor vehicle exhaust inspections through monitoring and other means, increase the number of motor vehicle centralized parking and maintenance areas

Strengthen the supervision and random inspection of exhaust emissions. Strengthen the supervision and random inspection of exhaust emissions for vehicles with a daily freight volume of more than 20 vehicles (medium and heavy trucks

Improve the emission testing and mandatory maintenance system for in-use vehicles.

Degree (I/M system), promote Chengdu to implement gasoline emission pollutant detection in-use vehicles in advance

Continue to promote the implementation of the vehicle pollutant emission limit b (GB18285-2018) standard.

Oil and gas recovery and treatment at oil depots, regular oil and gas recovery and treatment at gas stations, oil storage depots and tank trucks

Strengthen the supervision and inspection of the operation and maintenance of wastewater treatment facilities.

Strengthen the regulation of non-road mobile machinery. Promote the use of new energy and clean energy non-road

Accelerate the replacement and elimination of old non-road mobile machinery, and basically eliminate the national first

If the emission standards are lower than 15 years or the construction machinery is used for more than 15 years, the conditions are met and the replacement is allowed.

Replace engines with National III or higher emission standards. Strengthen the supervision of non-road mobile machinery

The non-road mobile machinery low emission control area is designated, and the built-up areas of cities at or above the county level are

Include areas where high-emission non-road mobile machinery is prohibited. Improve non-road mobile machinery

Coding registration work, promoting the installation of precise positioning systems and real-time emission monitoring for construction machinery

Devices to speed up the construction of monitoring informationization.

Improve the pollution prevention and control capabilities of ships and ports. Implement stricter ship emission standards.

Gradually improve the quality of ship fuel and promote the

The ships emit toxic and harmful gases during transportation and loading and unloading.

When transporting bulky or dusty goods, sealing or other protective measures should be taken.

Research and application of strong desulfurization and denitrification technology in ship exhaust treatment.

Recycling control, dust control at dry bulk terminals, dust control during loading and unloading, and other special treatments.

Machine Translated by Google

Establish air pollutant emission control zones for ships in key waters.

(3) Deepen the control of non-point source pollution.

Strengthen dust pollution control. Improve civilized construction and green construction management system.

Actively explore ways to include dust pollution from construction sites into the scope of environmental tax.

The "six hundred percent" construction standards are fully implemented, and video surveillance and PM10 monitoring are implemented in important construction sites .

Strengthen the management of cargo transportation by railways, roads, ports, etc. and take effective measures.

The closed area should be closed to reduce dust pollution, and wind and dust suppression facilities should be built where it is impossible to close.

Further increase the mechanized road cleaning rate and encourage the implementation of "5G+AI" in places with conditions.

By 2025, roads in built-up areas of cities at prefecture level and above will be

The mechanized road cleaning rate reached 80%, 70% in county towns, and 100% in prefecture-level and county-level cities in the Chengdu Plain.

The above cities reach 85% ÿ

Strictly control restaurant fume pollution. Optimize the development and spatial layout of the urban catering industry to avoid

Avoid the impact of cooking fumes on environmentally sensitive areas such as residences, medical and health care, cultural education, and administrative offices

All catering service units that produce cooking fumes in urban built-up areas should install cooking fumes

Purification equipment and maintain normal operation and regular maintenance. Promote Chengdu and other regions with conditions

Implement third-party operation and maintenance management of governance facilities and monitor operation status. Promote urban catering services

The construction and application of comprehensive management information of cooking fume in catering service enterprises, and strengthen the cooking fume exhaust of catering service enterprises

Strengthen the environmental protection publicity of household cooking fume emission and promote the use of high-efficiency

Purifying household range hood.

Strengthen the control of agricultural non-point source pollution. Strictly control open burning of straw and establish full coverage

Build a grid-based supervision system, strengthen the management and control of "fixed point, fixed time, fixed person, fixed responsibility", strengthen satellite

Remote sensing, high-definition video surveillance, drones and other means are used to improve the monitoring of straw burning fire points.

Machine Translated by Google

Focus on the planting and breeding industries to conduct a survey of atmospheric ammonia emissions and establish

Improve the atmospheric ammonia emission inventory. Guide farmers to carry out the combination of planting and breeding, and realize the use of livestock and poultry manure as fertilizer

Return the fertilizer to the field, reduce the use of chemical fertilizers, and reduce ammonia emissions. Strengthen the control of ammonia emissions from the aquaculture industry.

management, increase the research and development and promotion of low-protein feed varieties, and promote closed manure storage and treatment

management system, and encourage the research, development and application of efficient ammonia-containing gas treatment technology.

(IV) Strengthen coordinated control of pollutants.

Collaborative control of $PM2._5$ and ozone pollution.

Cities that meet the standards will continue to improve their air quality, and cities that fail to meet the standards will formulate and implement air quality

The deadline for achieving the target is spring and summer ozone and autumn and winter $PM2._5$ When pollution is the key control

In the next stage, cities that do not meet the standards will be the key control areas, and $PM2._5$ Coordinated control of ozone pollution

Strengthen the formulation and application of policy toolkits.

Focus on the region, strengthen joint prevention and control of air pollution, and explore regional coordinated governance

Establish a three-level heavy pollution weather emergency plan system at the provincial, municipal and county levels to improve the

Implement performance grading management for key industry enterprises and comprehensively implement

Reduce emissions in a different way, encourage staggered production and staggered seasonal operations, and supervise the implementation of staggered production.

Coordinated control of ozone-depleting substances (ODS) and hydrofluorocarbons (HFCs). strict

Strictly implement the relevant systems and plans for phasing out ODS and HFCs.

production, use and sales supervision, encourage and support the development and

Application, resolutely crack down on illegal production and illegal trade of ozone-depleting substances.

Improve the level of ODS and HFCs monitoring technology, establish an ODS and HFCs monitoring network, and improve HFCs

Establish a monitoring and data verification mechanism, organize and carry out monitoring and evaluation work.

Climate-friendly refrigeration technology, support the implementation of HFCs reduction demonstration projects, reduce trifluoromethane

Machine Translated by Google

(HFC-23) by-product rate and improve the recycling level of HFC-23.

Innovate and strengthen the management of toxic and harmful gases. Study and formulate toxic and harmful gas pollution prevention and control measures. Governance and management measures. Carry out prevention and control of toxic substances such as lead, mercury, tin, benzo(a)pyrene, and dioxins in key areas. Investigation and monitoring of harmful air pollutants, and regular dioxin monitoring of waste incineration power plants Supervisory monitoring and implementation of dioxin emission reduction projects in key industries. Strengthen implementation of the international mercury convention Capacity building, investigation and assessment of the current status of atmospheric mercury emission control and compliance gaps in key industries, Screening and demonstration of atmospheric mercury pollution prevention and control technologies for compliant industries. Encourage the development of toxic and Research on harmful gas pollution control technology and improve the health impact assessment mechanism. Environmental health and ecological risk prediction and forecasting capabilities, research and establish environmental air quality health index.

Column 4 Blue Sky and White Clouds Project

(I) Ultra-low emission and deep treatment projects Accelerate the ultra-low emission transformation of thermal power, steel, cement, coking and coal-fired industrial boilers. Complete the ultra-low emission transformation of all steel enterprises in the Chengdu Plain area and Chengyu Vanadium Titanium Technology Co., Ltd., and promote the relocation of Dazhou Iron and Steel Group Co., Ltd. from the city. Implement the electric energy replacement project of Sichuan Jiuda Salt Co., Ltd., the 35 tons/hour coal-fired boiler electric energy replacement project of Rongxian Chiyu Salt Products Co., Ltd., the Baima 2×475 MW gas turbine power generation demonstration project, and the ultra-low emission transformation project of flue gas of Sichuan Huadian Gongxian Power Generation Co., Ltd. Implement deep treatment projects for key industries such as flat glass, ceramics, ferroalloys, and nonferrous metals. (II) VOCs comprehensive treatment projects Focus on petrochemical, chemical, industrial coating, packaging and printing industries, implement low-VOCs raw and auxiliary material source replacement projects, and carry out pollution control facility transformation and upgrading. Implement VOCs comprehensive treatment projects in key parks such as Chengdu Automobile Industrial Park, Chengdu Petrochemical Industrial Park, and Nanchong Economic Development Zone.

(III) Mobile source and non-point source control projects focus on the Chengdu Plain, promote the replacement of new energy sources in public transportation, establish a non-road mobile source monitoring system, and promote the construction of pilot projects for comprehensive prevention and control of transportation pollution. Eliminate old motor vehicles, ships and non-road mobile machinery, and basically complete the elimination of diesel trucks that meet the National III emission standards. No less than 100 remote sensing monitoring (including black smoke capture) systems have been built in the province. Strictly control catering fume pollution and implement catering fume pollution control projects. Carry out special dust control projects for dry bulk terminals and loading and unloading dust in ports such as Yibin and Luzhou.

Machine Translated by Google

VI. Systematically promote the joint governance of "three waters" and consolidate and improve the water environment quality

Adhere to the dual efforts of pollution reduction and ecological expansion, strengthen the river and lake chief system, and coordinate water resources resource utilization, water environment management and water ecological protection, and continue to promote the protection and construction of beautiful rivers and lakes The plan will give the people more "green banks, clear waters, smooth rivers and beautiful lakes".

(1) Strengthen the protection and utilization of water resources.

Implement a rigid water resource constraint system. Adhere to the principle of determining cities, land and land by water. People, production based on water, strict water resource demonstration and water withdrawal permit for construction projects, and total water withdrawal and use In areas where water consumption has reached or exceeded the control target, approval of new water withdrawals will be suspended. The National Water Conservation Action Plan and Sichuan Province Water Conservation Action Implementation Plan promote the use of water from rough Implement dual control actions on total water consumption and intensity, strengthen Agricultural water conservation and efficiency improvement, industrial water conservation and emission reduction, urban water conservation and loss reduction, and increasing the utilization of unconventional water sources Strengthen the construction of water-saving irrigation areas, enterprises (parks), public institutions, schools and residential areas. Improve the water-saving incentive mechanism. Improve the supervision of key water users at the national, provincial and municipal levels. Control list, strengthen the supervision of the whole process of water conservation, and strictly control the construction of high water consumption projects. In 2017, the total water consumption in the province was controlled within 33 billion cubic meters, and the consumption per 10,000 yuan of GDP was The water volume and water consumption per 10,000 yuan of industrial added value decreased compared with 2020 and achieved the national target. Mark task.

Promote the optimal allocation and dispatch of water resources. Accelerate the implementation of key water resource dispatch projects. Improve the "five horizontal and six vertical" water network and enhance the cross-regional and cross-basin water resources allocation capabilities. Formulate the Yangtze River (Jinsha River), Yalong River, Yellow River, Chishui River, Qiong River and other important rivers The water resources dispatching plan for the Minjiang River, Tuojiang River, Jialing River, Anning River and other important rivers was formulated. Annual water allocation and dispatching plan for the river basin. Strengthen the unified dispatching and management of water resources.

Machine Translated by Google

Strengthen the joint dispatching of reservoirs and hydropower stations in the basin, and establish a system covering water ecology, flood control and drought relief, and storage.

Coordination mechanism for water supply, drinking water, irrigation, industry, power generation, shipping, etc.

Basic ecological flow, strengthen the cleanup and rectification of small hydropower, and in principle no new construction will be built in the Yangtze River Economic Belt

Small hydropower stations that do not meet the requirements of ecological protection will be categorized for rectification or phased out.

Strengthen ecological flow supervision monitoring, improve monitoring and early warning mechanisms, strengthen safeguard measures, and implement

By 2025, the ecological flow of key rivers and lakes will be guaranteed.

The barrier target is over 90%.

Increase the use of unconventional water sources. Actively build recycled water storage facilities and adopt reservoir

Strengthen the regulation of recycled water through regulation and storage, river and lake interception and storage, pond and cellar storage, and river-replacing reservoirs.

Promote the resource utilization of industrial wastewater, promote the integrated optimization of water use systems, and achieve

Serial water use, differentiated water use, multiple uses of water and cascade utilization.

Carry out unconventional water reuse and waterlogging control, increase the utilization of unconventional water sources, and use recycled water,

Incorporate rainwater collection and utilization into unified water resource allocation, and appropriately plan and layout recycled water

Transmission and distribution facilities to achieve comprehensive utilization in a wider space and field. Chengdu, Ziyang, Zigong, etc.

Municipal recycled water should be used as an important source of water for industrial production in regional parks.

By 2020, the recycled water utilization rate in water-scarce cities at the prefecture level and above will reach more than 25%.

(2) Strengthen the control of water pollution.

Strengthen the comprehensive treatment of industrial wastewater. Deepen the implementation of industrial enterprise wastewater treatment facilities upgrade

The focus is on the electronic information, papermaking, printing and dyeing, chemical industry, brewing and other industries wastewater treatment.

The project aims to achieve full compliance with industrial wastewater discharge standards.

For enterprises with wastewater that is difficult to degrade, strengthen the pretreatment of quality and classification, and improve the connection between enterprises and end treatment

The linkage monitoring capability of the sewage treatment facilities can ensure the safe and stable operation of the terminal sewage treatment facilities.

Machine Translated by Google

Promote the concentrated development of the electroplating industry and implement a number of pilot projects for "zero discharge" of electroplating wastewater

Carry out upgrading and renovation of the centralized sewage treatment facilities in the development zone and investigation and rectification of the sewage pipe network

Improve the rainwater and sewage diversion system in industrial parks and enterprises, promote the collection and treatment of initial rainwater, and encourage

Industrial parks with conditions will implement “one enterprise, one pipeline, open pipeline transportation, and real-time monitoring”. Promote existing

Enterprises and parks carry out green, high-quality transformation and upgrading and circular reform with a focus on water conservation.

speed up the construction of water-saving and water recycling facilities, and promote the connection of water use and water quality among enterprises.

Water use, multiple uses and recycling of water are encouraged, and provincial-level

And above parks are actively carrying out the creation of water-saving benchmark parks.

Improve the level of urban sewage treatment. Promote the construction of urban "zero sewage discharge areas"

Cities in the basins of the Yangtze River, Tuojiang River, Sichuan-Chongqing cross-border rivers, and cities with low sewage treatment rates

Focus on the overall planning of urban development, and accelerate the development of urban development in accordance with the principle of adapting measures to local conditions and being moderately advanced.

Promote the construction of sewage treatment facilities and pipeline networks, and basically eliminate domestic sewage in cities at prefecture level and above.

The focus is on urban villages, old urban areas, urban-rural junctions, and established towns.

Investigation and construction of sewage pipe network coverage. Coordinated renovation and repair of old and damaged pipe networks.

We will carry out rainwater and sewage separation transformation of combined sewer systems according to local conditions.

Sewage treatment standard improvement and efficiency enhancement projects for cities and towns above 4000 square meters.

The tailwater ecological wetland of sewage treatment facilities can further purify the drainage water quality.

The results of black and odorous water treatment in urban built-up areas have been improved, and black and odorous water treatment in urban built-up areas at the county level and above has been carried out.

For the treatment of odorous water bodies, areas with conditions should coordinate urban and rural areas and promote the treatment of black and odorous water bodies across the region.

By 2022, all built-up areas of cities at or above the county level in the province will basically achieve full coverage of sewage collection pipe networks.

By 2025, the centralized collection rate of urban domestic sewage in the province will be increased by 5% compared with 2020.

percentage points, the sewage treatment rate of established towns has increased significantly, and the sewage treatment rate of county towns has reached

Machine Translated by Google

Over 95%.

Strengthen agricultural pollution prevention and control. Prepare the Sichuan Provincial Agricultural Non-point Source Pollution Control and Supervision Guidelines

Identify priority areas for agricultural non-point source pollution control and coordinate the promotion of agricultural non-point source pollution control.

A number of agricultural pollution control projects have been launched in the Sichuan Basin, Anning River Valley, and the Yellow River Basin.

Demonstration and pilot projects for pollution control at non-point sources. Strengthen farmland pollution control in areas with prominent non-point source pollution in the crop industry.

Ecological recycling of tailwater and construction of ecological interception ditches for nitrogen and phosphorus in farmland.

Comprehensive improvement of the water environment in villages, and promotion of the “four

The rectification of the "disorderly" problem has been normalized and standardized, and has been continuously extended to small and medium-sized rivers and rural rivers and lakes.

Return ecological space to rivers and lakes. Strengthen comprehensive prevention and control of aquaculture pollution and promote livestock and poultry breeding.

Comprehensively utilize manure resources and create green demonstration counties (cities, districts) for animal husbandry.

By 2025, the supporting rate of manure treatment facilities in large-scale livestock and poultry farms (communities) will reach

95%, and the comprehensive utilization rate of livestock and poultry manure reached more than 80%. Actively promote the new rice-fish integrated

Combined breeding and large-scale ecological breeding, promoting the comprehensive management of aquaculture tailwater in the main aquaculture production areas

Governance.

Strengthen the treatment of rural domestic sewage. Formulate and implement special measures for rural domestic sewage treatment.

A plan to coordinate rural domestic sewage treatment.

Focus on areas with concentrated black and odorous water bodies, and promote rural domestic sewage treatment in stages.

Promote the effective connection between rural toilet revolution and domestic sewage treatment according to local conditions, and promote sewage management

The network construction will be extended to rural areas. By 2025, 75% of administrative villages will have rural domestic sewage

Effectively managed. Conduct a survey on the operation of completed rural domestic sewage treatment facilities

Evaluation, strengthen the long-term operation and maintenance of rural domestic sewage treatment facilities, formulate and implement

Maintenance and management measures to achieve daily treatment of 20 tons or more of rural domestic sewage treatment facilities

Machine Translated by Google

Water quality monitoring is fully covered. Comprehensive treatment of black and odorous water bodies and water systems in rural areas is implemented in a coordinated manner.

The rural black and odorous water bodies will be managed in an orderly manner. By 2025, the rural black and odorous water bodies under national supervision will be

The water treatment rate has reached about 40%.

Strengthen the investigation and rectification of sewage outlets into rivers. Implement the requirements of "investigation, measurement, tracing and treatment" to find out

The number of sewage outlets into rivers in the province, the amount of water, types of pollutants and water quality at these outlets,

Clarify the responsible entities for sewage outlets into rivers, and promote the discharge of sewage into rivers in an orderly manner according to the principle of "three batches".

Implement a system for the rectification and cancellation of sewage outlets into rivers, and strictly implement the "one outlet, one

The requirements for rectification should be clarified, the rectification targets and time limits should be clarified, the setting of sewage outlets should be standardized, and

Effectively control the discharge of pollutants into rivers. Promote the implementation of local government management responsibilities and industry

The supervisory responsibilities of the competent authorities should be gradually established with "clear responsibilities, standardized management and adequate supervision".

By the end of 2023, all sewage outlets into rivers will be completed.

Standardized management and control have been established to form a relatively complete management system and a relatively scientific technical system for river discharge.

Sewage outlet setting and supervision management system.

Strengthen the prevention and control of pollution in ports, terminals and ships. Promote the construction of bulk cargo terminals in ports along the Yangtze River.

Clean transformation. Accelerate the port ship pollutant reception and transfer, chemical ship

Construction of environmental infrastructure such as tank cleaning stations to improve the port's ship pollutant reception and transfer facilities

Accelerate the improvement of domestic sewage storage equipment or treatment facilities for transport ships,

Focus on promoting the installation and renovation of pollution prevention and control facilities for existing ships with a gross tonnage of less than 100 tons, and

Lugu Lake, Heilongtan, Bailong Lake and other important lakes and reservoirs were the first to implement ship sewage

Zero emission. Strengthen the prevention and control of ship pollution, regularly check the ship pollution prevention documents and pollutant storage

Containers, as well as the generation and delivery of pollutants such as ship garbage and oily sewage

Supervision and inspection. Strengthen the safety and environmental protection supervision of hazardous chemicals transportation on water and oil spills from ships

Machine Translated by Google

Risk prevention.

(3) Carry out water ecological protection and restoration.

Waterfront and shore areas work together to promote river and lake ecological protection and restoration. Strictly manage river and lake ecological buffer zones.

Strengthen the management of shoreline use, strengthen the control and intensive use of shorelines, restore the ecological functions of river and lake shorelines,

Deepen the construction of beautiful coastlines. Focus on the upstream areas of each river basin and Lugu Lake, strengthen

Water conservation areas are closed for protection, conservation forests are constructed, and water conservation functions are enhanced.

The Yangtze River, Tuojiang River, Jialing River and other river basins are the focus, and river and lake shoreline restoration and shore buffer projects along the route are implemented.

Water ecological protection and restoration, including ecological restoration of river belts, restoration of estuarine wetlands, and ecological restoration of rivers and lakes

Engineering to reduce the disturbance and damage to lakes (rivers) caused by human production activities and natural processes, and restore

Restore the structure and function of river and lake ecosystems. Promote the orderly construction of the Tuanjie Reservoir, Yongning Reservoir, and Fujiang Reservoir.

Preliminary demonstration of large and medium-sized projects such as the Right Bank Water Diversion, Panzhihua Water Resources Allocation, and Tugongmiao Reservoir

Work should be started when conditions permit, and the connectivity of rivers and lakes in the Yangtze River Basin should be gradually improved.

Block the ecological flow of rivers and lakes and maintain the ecological functions of river and lake systems.

Protect aquatic life and improve the quality of water ecosystems. Strictly implement the “Ten-year Ban” in the Yangtze River.

Carry out natural habitat restoration, habitat replacement protection,

Aquatic plant resource protection, "three fields" protection and restoration projects, etc., to improve and restore aquatic

Biological habitats. Carry out measures such as restoration of aquatic biological migration channels and microhabitat repair to strengthen

Construction of national and provincial nature reserves for rare fish, restoration of rare, endangered, endemic and other important

Aquatic habitats. Strengthen the protection of floodplains, shoals, lakes, reservoirs, and banks of the Yangtze River and its tributaries.

The protection and restoration of biodiversity in the Yangtze River Basin, estuary mudflats, etc.

The task of increasing the number and releasing rare and endemic fish species such as the black carp, thick-jawed bream, rock carp, and black carp.

Coordinate and promote water ecological surveys in key river basins, and carry out water ecological surveys in the Minjiang, Tuojiang, Jialingjiang,

Machine Translated by Google

The Yalong River, the Heihe River, the Baihe River and other major rivers in the Yellow River Basin have carried out aquatic biological integrity surveys.

evaluate.

(4) Strengthen the protection of drinking water sources.

Consolidate and improve the protection level of drinking water sources at the county level and above.

Water source layout and water supply pattern, scientifically and rationally carry out the demarcation of protected areas, and continuously promote

Standardized construction of water sources. Strengthen the protection of drinking water sources,

Carry out remediation of drinking water sources with environmental problems. Establish cross-administrative region water source protection

Joint prevention and control mechanism, jointly carry out cross-border drinking water sources such as Hongqi Reservoir and Laoying Reservoir

Improve the water quality monitoring and early warning capabilities of drinking water sources, and carry out centralized drinking water

Water source monitoring and environmental status survey and assessment, regular disclosure of drinking water safety status to the public

Accelerate the construction of urban emergency backup water sources, strengthen daily management, and improve the urban water supply system.

By 2025, drinking water sources in cities at or above the county level will be

The quality compliance rate reached 100% ÿ

Accelerate the protection of rural centralized drinking water sources. Complete the protection of centralized drinking water sources at the township and below levels.

The Chinese drinking water source protection area is delineated. The centralized drinking water supply system at the township and below level is continuously promoted.

Standardized water source management, completed water source signage, isolation and protection and other infrastructure construction

Comprehensively clean up and rectify the environmental problems of drinking water sources in townships and below, deepen the non-point source pollution

Pollution prevention and control, and conduct remediation of substandard water sources. Gradually establish and improve rural drinking water safety

Full protection system, focusing on improving the wind power of townships and “thousand tons per 10,000 people” centralized drinking water sources

Strengthen the supervision of rural drinking water source environment, standardize monitoring and control,

Improve the list and archive management of centralized drinking water sources at the township level and below.

(V) Deepen the prevention and control of groundwater pollution.

Machine Translated by Google

Carry out comprehensive investigation and assessment of groundwater environment status.

Investigation, assessment and capacity building project.

Gas stations, lead and zinc mining areas, tailings ponds, hazardous waste disposal sites, chemical parks and chemical projects

Conduct investigation and assessment on key groundwater pollution sources and surrounding groundwater environmental risk hazards

By 2022, complete the groundwater environmental assessment of 25 provincial and other chemical parks.

Environmental status survey and assessment, focusing on centralized groundwater drinking water sources and groundwater pollution

At least 2,600 environmental monitoring points were set up at pollution sources to initially understand the distribution of groundwater pollution.

Establish and improve the basic database of groundwater pollution and the priority

Control the list first.

Systematically carry out coordinated prevention and control of groundwater pollution. Strengthen coordinated prevention and control of surface water and groundwater pollution.

Joint prevention and control, accelerate the renovation of urban sewage pipe networks, strengthen the scientific and

Standardized management. Strengthen the coordinated prevention and control of soil and groundwater pollution, and strengthen the management of soil pollution risks.

In the process of control, full consideration should be given to the impact on groundwater and pollution prevention and control, and overall arrangements, synchronous consideration,

Strengthen the coordinated prevention and control of groundwater pollution in the region and on the site, with the “dual source” (ground

Focus on underground centralized drinking water sources and key pollution sources, and clarify groundwater protection

The scope of the pollution control area, prevention and control area and pollution treatment area is proposed to provide a feasible groundwater pollution zoning prevention and control area.

Promote the construction of groundwater pollution prevention and control pilot projects, select typical pollution sources, and

Carry out prevention, control, restoration and management pilot projects step by step, and form a group of underground

Water pollution prevention and control projects.

(6) Promote the protection and construction of beautiful rivers and lakes.

Strengthen ecological environment management of lakes and reservoirs. Strictly control development and construction activities, protect and restore

The natural ecological environment of lakes and the ecological security of lakes and important water sources are maintained.

Machine Translated by Google

For lakes and reservoirs that have reached or exceeded Class III, we should adhere to the principle of giving priority to protection and focusing on natural recovery. We will build a protective forest belt around the lake and reservoir and an ecological isolation belt to fill in the gaps in infrastructure and further Improve soil and water conservation and water conservation capacity. Carry out eutrophication water conservation for lakes and reservoirs that do not meet the standards. Comprehensive improvement of the system, implementation of river and lake shore ecological interception, internal source control, artificial wetland water quality purification Chemical engineering to build a lakeside ecosystem with a reasonable structure and stable functions.

Strengthen ecological and environmental governance of key rivers.

Comprehensive treatment projects will be carried out to improve the sewage collection and treatment capacity of cities and towns along the route, and to accelerate the implementation of Implement a number of artificial wetland and river buffer zone projects with high maturity and obvious benefits. Strengthen soil and water conservation in the Jinsha River, Yalong River, Anning River and other river basins, and implement shoreline ecological Restoration, and efforts to increase vegetation coverage.

In the river basins involving national and provincial aquatic biological protection areas and aquatic germplasm resource protection areas, Restoration of river basin ecology to improve the habitat of rare and endemic fish.

Establish a cold grassland swamp ecological protection and management system and implement a comprehensive wetland restoration and management project. Urban landscape water bodies, combining park cities and greenways to build ecological corridors along the river, implement The projects of ecological riverside belt, shoreline improvement, river wetland, etc., build a benign ecological environment for urban water environment Circulatory system.

Strengthen the demonstration and guidance of beautiful rivers and lakes. Strengthen the river and lake chief system and decompose the protection of beautiful rivers and lakes. In line with the construction task requirements, formulate the evaluation standards for beautiful rivers and lakes in Sichuan Province, strengthen the management of water-related spaces, Control, continue to promote the construction and pilot of beautiful rivers and lakes. Deeply explore the cultural heritage of beautiful rivers and lakes, Comprehensively implant local cultural elements to combine river and lake ecological protection projects with water culture The construction of beautiful rivers and lakes will become a new form of inheriting local folk customs and highlighting local history. A new carrier of historical culture.

Machine Translated by Google

Column 5: Clean Water and Green Bank Project

(I) Water resources dispatching projects We

vigorously promote the two super-large projects of diverting water from the Yangtze River to Minjiang and the Long March Canal, accelerate the construction of major water conservancy projects such as the first phase of the Xiangjiaba Irrigation Area, the first phase of the Tingzikou Irrigation Area, and the second phase of the Daqiao Reservoir Irrigation Area, and actively promote the preliminary work of major projects such as the second phase of

the Xiangjiaba Irrigation Area, the Guanziba Reservoir,

and the second phase of the Pihe Water Supply. (II) Urban water pollution prevention and control projects We implement urban sewage treatment plant upgrading and transformation projects in the Yangtze River mainstream, Minjiang River, Tuojiang River and other river basins. We implement artificial wetland water purification projects in small river basins such as Jiuqu River, Pujiang River, Yaoshi River, Fuxi River, Tongbo River, and Xiaoyanghua River, and carry out deep treatment of sewage treatment plant tail water. We implement

a number of reclaimed water reuse projects in Chengdu,

Zigong, Ziyang, Meishan and other regions. (III) Industrial pollution deep treatment projects We carry out deep treatment of wastewater in industries such as electronic information, papermaking, printing and dyeing, chemical industry, and brewing. Renovate the centralized treatment facilities for high-salt wastewater in major pickle production areas such as Pengzhou in Chengdu, Dongpo in Meishan, and Lezhi in Ziyang. Promote the construction of sewage treatment facilities in industrial concentration areas such as Tianqiong Industrial Park, Southwest Aviation Group Industrial Concentration Development Zone, Mianzhu Logistics Park, and Sichuan (Chishui River) Gulin Jiangxiang Wine Valley Ecological Industrial Park. Accelerate the construction of reclaimed water reuse projects in key parks such as Zigong Yantan High-tech Industrial Park, Meishan High-tech Industrial Park, and Guang'an Economic and Technological Developme

(IV) Rural water environment governance projects

Continue to carry out the construction of the "Thousand Villages Demonstration Project" for rural domestic sewage treatment, and complete the sewage collection and treatment of 4,500 administrative villages. Carry out demonstration pilot projects for comprehensive treatment of agricultural non-point source pollution. In Chengdu, Guang'an, Meishan, Ziyang and other areas, implement a number of farmland drainage and surface runoff purification projects. Complete the treatment of 65 rural black and odorous water bodies. Implement aquaculture tailwater comprehensive treatment projects in key aquaculture counties (districts) such as Chengdu Jianyang, Neijiang Longchang, Neijiang City Central District, Zigong Fushun, Mianyang Yanting, Nanchong Yingshan, Meishan Dongpo, Leshan City Central District, and Leshan Jingyan. (V) Drinking water source protection projects Carry out the

establishment of drinking water source signs and

protection and isolation projects in Zigong, Bazhong and other cities (prefectures). Carry out cross-border drinking water source protection projects such as Hongqi Reservoir and Laoying Reservoir. Implement standardized treatment and restoration projects for drinking water source protection areas in Zigong, Luzhou, Yibin, Guang'an, and Bazhong townships and below. Carry out comprehensive treatment projects for substandard centralized drinking water sources in townships. Carry out the construction of the third water source in Chengdu, carry out the construction of municipal backup drinking water sources in Mianyang, Guang'an, Dazhou, etc., and carry out the construction of county-level backup drinking water sources in Meishan Renshou, Neijiang Zizhong, Panzhihua Renhe, etc. (VI) Promote the beautiful river and lake project to improve the water conservation capacity of good water bodies such as Yalong River, Jinsha River, Dadu River,

Qingyi River, and implement projects to fill the gaps

in infrastructure. Carry out natural wetland protection and restoration, lake and reservoir protection forest belts, ecological isolation belts, ecological landscape forest belts and other projects for important lakes such as Hanyuan Lake, Lugu Lake, Qionghai, and Baihetan. Implement environmental improvement projects for Luban Lake, Sancha Lake, Changhong Lake, Yannan Lake, Fenghuang Lake, Shengzhong Lake, etc. Carry out comprehensive management projects for cross-border basins in Sichuan and Chongqing, as well as key basins such as Minjiang River, Tuojiang River, Jialing River, and Chishui River. Implement soil erosion control, vegetation restoration, biodiversity protection and other projects for Jinsha River and Anning River. Implement ecological restoration projects for rivers and lakes in the Yangtze River mainstream, Qujiang River, Tianquan River, Zhougong River, etc. Implement comprehensive water management projects in small watersheds such as Jinjiang River, Fuhe River, Jiangxi River, Jinma River, Jinyu Creek, and Yuzi Creek.

Machine Translated by Google

7. Solidly promote the clean land and waste reduction campaign to maintain the overall stability of the soil environment

Strengthen the prevention and control of soil pollution sources, deepen soil risk management, and focus on heavy metal pollution

Prevention and control, strengthen the classification and disposal of solid waste, improve the comprehensive utilization of solid waste, and ensure the

The surname means "eat with peace of mind and live in peace of mind".

(1) Promote source control of soil pollution.

Strengthen spatial layout control. Strengthen the rigid constraints of planning and environmental impact assessment, strictly control space,

Rationally plan land use, strengthen the layout demonstration of construction projects involving soil pollution, encourage

The key industrial enterprises that cause soil pollution are concentrated and developed, and the soil environment carrying capacity is analyzed.

Only in residential areas, schools, hospitals, sanatoriums and nursing homes around the new (renovation, expansion)

Construction projects that may cause soil pollution are prohibited in areas where permanent basic farmland is concentrated.

New construction projects that may cause soil pollution.

Prevent new soil pollution. Strictly control the access of key industry enterprises and standardize new (modified,

Soil environmental survey of expansion and construction projects, implementation of soil pollution prevention and control requirements involving toxic and hazardous substances

Continue to promote the investigation and rectification of enterprises in the heavy metal industries such as cadmium around cultivated land, and update the dynamics

New pollution source investigation and remediation list. Strengthen the supervision of farmland irrigation water, with Dujiangyan and other large and medium-sized

Focusing on the irrigation area, we will carry out water quality monitoring of farmland irrigation water to ensure that the water used for farmland irrigation reaches

Promote the analysis of the causes of soil pollution in cultivated land, identify the main sources of pollution, and implement

Carry out pollution source control and block the pollution pathways.

Strengthen the supervision of key pollution sources. Deepen the application of the results of detailed investigation of land use by key industries and enterprises.

Dynamically update and improve the list of key soil pollution supervision units. Implement key supervision

The main responsibility of the unit is to include the soil pollution prevention and control obligations of key supervision units into the pollution discharge permit

Machine Translated by Google

It is manageable and regular self-monitoring and supervisory monitoring of key soil pollution supervision units should be carried out.

Strengthen the investigation of soil pollution hazards. Key supervision units should carry out key sites and

Investigate soil pollution risks in key facilities and equipment, formulate and implement rectification plans for pollution risk areas

The plan encourages key soil pollution supervision units to implement anti-leakage improvements such as pipelines and sealing.

Strengthen the supervision of mining pollution and strictly control environmental pollution during the mineral development process.

(2) Strengthen soil pollution risk control.

Deepen soil pollution investigation and assessment. Improve soil environmental quality in areas with high heavy metal backgrounds

The survey focused on Panxi, southern Sichuan and northeastern Sichuan, and carried out supplementary surveys to comprehensively survey

The soil environmental quality of agricultural land in the province was fully understood.

Coordinated surveys of soil environmental quality and agricultural products in agricultural land, and dynamic updates of risk control scope

Promote the development of development zones, oil depots, gas stations, abandoned mines and tailings ponds, and centralized drinking water

Survey soil environmental quality in sensitive areas such as water sources, landfills and incinerators to find out

Soil environmental risks. Conduct land surveys and assessments of typical enterprises outside 73 industries, and promote

Conduct detailed investigation and risk assessment of the bidding enterprises.

Strengthen the risk control of soil pollution in agricultural land. Deepen the classification management of agricultural land.

Dynamically adjust the soil environmental quality category, strengthen the supervision of grain storage and circulation, and eliminate

Grains with excessive heavy metal content have entered the food grain market.

Strengthen the protection of priority protected farmland to ensure that its area does not decrease and the soil environmental quality does not

Strengthen the supervision of strictly controlled arable land and designate specific agricultural products that are prohibited from production according to law.

In the area, planting of edible agricultural products is strictly prohibited. Continue to promote the safe use of contaminated agricultural land and strictly

Implement safe utilization plans for contaminated farmland, promote the application of variety substitution, water and fertilizer regulation, soil

Machine Translated by Google

Soil conditioning and other technologies, explore the establishment of a safe land utilization technology library and negative agricultural product planting list, strengthen the creation of pilot demonstration counties (cities, districts) for safe utilization, and by 2025, polluted safe utilization rate of farmland has reached 93% . Carry out the restoration of polluted farmland and the treatment of acidified soil, and the Manage the pilot projects and promote the construction of long-term observation and research bases for soil ecological environment in phases and batches.

Promote risk control of construction land. Continuously update suspected contaminated plots, contaminated plots, List of soil pollution risk control and remediation for construction land, promoting soil pollution risk control Local standards are formulated. Strictly manage the access to polluted land and carry out soil Pollution status survey and risk assessment, prohibiting failure to achieve soil pollution risk control and remediation goals Any project not related to risk control and restoration will not be started on the target land. The purpose of the land and the timing of its development and use should be determined before the relevant land space planning is submitted for review. Complete the soil pollution status survey and risk assessment of relevant plots. Explore the sideline production of enterprises The soil pollution risk control model of production-side control is promoted. Prevent and control secondary pollution during the restoration process, and improve the post-management and evaluation mechanism of soil restoration sites.

Strengthen environmental supervision of unused land. Strictly adhere to the bottom line of ecological safety and Unused land within the red line must be strictly protected in accordance with laws, regulations and relevant plans. Strictly investigate illegal discharge of pollutants and dumping of toxic and organic substances into tidal flats, wetlands, swamps, etc. Strengthen the supervision of areas affected by mining and other mineral resource exploitation activities. Environmental supervision of unused land in the region. Unused land is planned to be reclaimed as farmland or construction land. A soil pollution survey should be conducted to confirm that the land meets the functional requirements before development. use.

Carry out the construction of soil pollution risk control areas in the upper reaches of the Yangtze River and the Yellow River.

Machine Translated by Google

The construction idea of "governance and construction" is to integrate scientific research and technical forces, highlight source control, and improve risk management.

To establish a soil risk control and management system that can be promoted and replicated in Sichuan.

Improve the construction of soil environmental management and response systems in industrial and mining enterprises. Strengthen soil environmental risk analysis

District management, and construction of 15 soil risk zoning control pilot areas such as Longquanyi and Xichang.

Strengthen the research and development of soil pollution prevention and control technology, highlight information construction, explore soil environment

Basic research on background value, soil environmental capacity and soil ecological effect, etc., promotes soil pollution

Research and development of complete sets of equipment and applicable technologies for treatment and restoration.

(3) Continue to promote the prevention and control of heavy metal pollution.

Strengthen the prevention and control of heavy metal pollution. Strictly control the environmental access of enterprises and parks involving heavy metals.

New (renovation, expansion) construction projects in key industries involving heavy metals shall implement equal replacement or reduction

Continue to adjust the industrial structure and optimize the layout, and accelerate the promotion of environmentally sensitive areas and

Relocation and closure of heavy metal-related enterprises in urban built-up areas. Promotion of lead-acid batteries, electroplating, nonferrous metals

The construction of industrial parks such as metal smelting will guide heavy metal-related enterprises to enter the parks and promote the environmental protection of the parks.

Ensure infrastructure construction. Carry out investigation and rectification of enterprises involved in thallium. Strengthen the supervision of enterprises involved in heavy metals.

Industry supervision, including enterprises involved in the heavy metal industry into the list of key air and water pollutant discharge units

Improve the level of heavy metal pollution prevention and control, strengthen classified prevention and control in key areas, and continue to increase

Comprehensive governance efforts will be made in Chengdu Xindu, Deyang Shifang, Liangshan Xichang and other regions, and efforts will be made to strengthen the Ya'an Han

Sources, asbestos, heavy metal emission control in Huidong, Huili and Ganluo, Liangshan.

Control metal pollution and promote comprehensive improvement of the heavy metal environment in the Anning River Basin.

Strengthen the control of heavy metal pollution in key industries. Strengthen the level of clean production and pollutants

emission intensity and other indicators to optimize layout, structural adjustment, upgrading and deep treatment

Machine Translated by Google

We will promote the implementation of a number of heavy metal emission reduction projects and continue to reduce heavy metal

Pollutant emissions. Increase production process improvements in non-ferrous metal smelting, inorganic acid manufacturing and other industries.

Increase the transformation efforts, accelerate the replacement and transformation of vertical tank zinc smelting equipment in zinc smelting enterprises, and actively promote the

Smelting enterprises carry out converter blowing process upgrade and transformation. Implement the lead, zinc and copper smelting industry

The industry should be upgraded and transformed, and enterprises around cultivated land should strictly implement the special requirements for key air pollutants such as particulate matter.

Strengthen the total thallium content of wastewater from enterprises in nonferrous metals, steel, sulfuric acid, phosphate fertilizer and other industries.

Governance.

(4) Strengthen the classification and disposal of solid waste.

Establish a solid waste information list. Deepen the solid waste declaration and registration system and implement

The main responsibility of industrial enterprises for pollution prevention and control is to establish and dynamically update the key monitoring points for solid waste.

Carry out investigation of major solid waste (hazardous waste) storage sites and establish

"One library, one file". Explore the development of "QR code" digital information of solid waste (hazardous waste)

Registration and management system. Carry out pilot projects on the declaration and registration of hazardous wastes, and find out the sources,

transfer, storage, utilization and disposal of hazardous wastes, promote the establishment of the “three lists” of hazardous wastes, and maintain

Continue to promote the standardized environmental management assessment of hazardous wastes.

Strengthen source reduction. Promote industrial waste reduction actions, extend the industrial chain of key industries, and encourage

Encourage enterprises that generate large amounts of solid waste to carry out clean production and reduce the amount of solid waste generated.

Promote the reduction of construction waste at the source and vigorously develop prefabricated concrete and steel structures.

Strictly control the classification of domestic waste and promote

Collect and dispose of hazardous waste in domestic waste, and strengthen the resource utilization of kitchen waste.

Comprehensively investigate the historical wastes that are randomly stored in mining areas, formulate remediation plans, and gradually eliminate the wastes.

Machine Translated by Google

Promote the construction of "zero waste cities" pilot projects and strive to build "zero waste cities" by 2025.

5. Encourage qualified parks and enterprises to strengthen resource coupling and recycling, and create

"Zero waste park" and "zero waste enterprise".

Improve the level of comprehensive utilization. Build a resource recycling industry system and enhance the

Comprehensive utilization technology of solid waste to improve resource utilization efficiency, and carry out

Pilot projects for resource utilization of waste oil-based cuttings and fracturing flowback fluid from shale gas, and strengthening the use of waste power

Complex and difficult-to-use industrial solid waste such as pools, vanadium-titanium magnetite smelting waste, phosphogypsum, electrolytic manganese slag, etc.

Research and develop technologies for the large-scale utilization of solid waste, and encourage large and medium-sized enterprises and various development zones to allocate

By 2025, the new large-scale solid waste comprehensive utilization project

The comprehensive utilization rate reached 60%. Promote the construction of comprehensive utilization facilities for hazardous wastes and accelerate the

The construction of comprehensive utilization facilities for batteries, lead-containing waste, mercury-containing waste, etc. has gradually formed a "market

Regulation, complete categories, regional coordination and resource sharing".

Ensure the construction of disposal capacity. Continue to promote the disposal of industrial solid waste, domestic garbage, and construction

Construction of solid waste disposal facilities such as garbage and agricultural waste, and strengthening of living standards in urban built-up areas

Construction of domestic waste incineration facilities in areas where daily waste collection exceeds 300 tons

Further improve the level of sludge harmlessness, and by 2025, the incineration capacity of urban domestic waste

The proportion reached 60%, and the harmless disposal rate of urban sludge reached more than 90%.

The centralized disposal of medical waste and the disposal of medical waste are included in the overall construction of public infrastructure.

Large enterprises share hazardous waste utilization and disposal facilities, and promote water conservancy projects in Zigong, Guang'an and other cities.

The mud kiln coordinated disposal project will be built. By 2022, the province's hazardous waste disposal capacity will be

Standardize the collection and storage of hazardous waste from small, medium and micro enterprises and social sources.

Machine Translated by Google

By 2023, the hazardous waste collection rate in all cities (states) will reach 90%.

Strengthen the classification management of medical waste and make up for the shortcomings of regional medical waste disposal.

By 2020, the harmless disposal rate of medical waste in built-up areas of cities at the county level and above reached over 99%.

Column 6: Clean Land and Waste-Free Project

(I) Soil environmental quality survey and assessment project Carry out intensive surveys of "source-related" polluted agricultural land, and implement soil environmental quality surveys and assessments with a focus on mineral resource development concentrated areas such as Panxi, southern Sichuan, and northwestern Sichuan. Carry out soil pollution status surveys and risk assessment projects for closed and relocated plots in Zigong, Panzhihua, Deyang, Yibin, Ya'an, Liangshan and other regions. Carry out soil environmental quality surveys and assessments in the historical mining areas and their surrounding areas in the Chishui River Basin. (II) Contaminated soil safe utilization project Focus on closed and planned mining areas such as the lead and zinc mining and smelting industries in Huidong, Huili, Mianning, Ya'an, Hanyuan and other regions in Liangshan, and carry out pilot work on ecological governance and restoration of typical mining areas. Comprehensively promote ecological restoration projects for historical abandoned mines in key areas such as the Anning River Basin. Focus on historical mining areas in the Chishui River Basin, and carry out soil pollution source risk control or ecological governance and restoration pilot projects. Implement soil pollution remediation and risk control projects for industrial and mining enterprises in Chengdu, Panzhihua, Deyang, Yibin and other places. Carry out investigation of the causes of heavy metal pollution in cultivated land in key areas and demonstration of safe use of agricultural land. Carry out adjustment of planting structure or land use planning of heavily polluted cultivated land. Promote the construction of long-term observation and research bases for soil ecological environment. Promote the construction of water, air and soil coordination early warning system in key development zones. (III) Heavy metal pollution prevention and control projects Continue to carry out heavy metal emission reduction projects for key regulated enterprises across the province. Continue to promote the construction of lead-acid battery collection in Ganluo County. Environmental protection infrastructure construction in parks such as the Central Development Zone, Sichuan Hanyuan Industrial Park, and Sichuan Shimian Industrial Park. (IV) Comprehensive utilization of solid waste projects Accelerate the implementation of waste incineration power generation projects in Neijiang, Leshan, Guang'an, Bazhong and other places. Carry out pilot projects for the comprehensive utilization of phosphogypsum in Deyang, Neijiang, and Mianyang, support the comprehensive utilization of smelting slag and tailings in Panzhihua, Leshan, Ya'an, Liangshan and other places, and promote the construction of large-scale solid waste comprehensive utilization bases and industrial resource comprehensive utilization bases in Panzhihua, Deyang, Guangyuan, Ya'an, Liangshan and other places. Carry out the construction of national and provincial resource recycling bases in Chengdu, Deyang, Guangyuan, Leshan, Nanchong and other places. Adopt a joint construction and sharing approach to build domestic waste incineration power generation facilities. Build a number of industrial solid waste landfills with high-standard management specifications in Zigong, Panzhihua, Luzhou, Leshan and other places. Implement fly ash and coal gangue resource utilization projects in Panzhihua, Mianyang, Yibin and other places. (V) Hazardous waste and medical waste disposal capacity construction projects Actively promote the construction of cement kiln coordinated disposal projects in Zigong, Guang'an and other cities. 12 new hazardous waste centralized disposal projects and 10 medical waste disposal centers have been built, and mobile medical waste disposal facilities have been built for 25 remote counties. In accordance with the principle of "five-area coordination", mobile medical waste mobile disposal facilities are built in different areas to comprehensively improve the province's hazardous waste disposal capacity and medical waste emergency disposal level.

Machine Translated by Google

8. Strengthen risk prevention and mitigation to safeguard the bottom line of ecological and environmental safety

Firmly establish the bottom line thinking of environmental safety and build a full-process, multi-level ecological environment Safety and emergency management systems, strict environmental management in key areas such as chemicals, nuclear and radiation management, effectively control environmental risks, and ensure ecological security.

(1) Strengthen environmental risk prevention.

Strengthen the prevention and control of river basin and regional environmental risks. The layout of storage enterprises should be integrated into the regional development plan and the national land space plan. Environmental risk base, promote the Yangtze River (Sichuan section), Yellow River (Sichuan section), Tuojiang River, Minjiang River Environmental risk assessment and emergency preparedness for 13 key river basins, including the Yangtze River, Fujiang River, Jialing River, and Chishui River. Coordinated promotion of comprehensive prevention and control of river basin ecological and environmental pollution, risk control and ecological Restoration, forming a number of comprehensive ecological environment improvement and risk control projects. By 2022, Complete the revision of emergency plans for sudden ecological and environmental incidents at the county level and above. Tuojiang River, Jialing River, Chishui River, Yangtze River and other key rivers, as well as concentrated Focus on the surface water drinking water sources, coordinate and promote the "one river" environmental emergency response in key rivers "One policy, one map". Explore the drawing of a provincial environmental emergency map. Encourage local governments to combine regional In practice, carry out investigation and assessment of ecological environment and health impacts.

Strengthen risk prevention and control in industries, parks and enterprises. Improve the management of environmental safety hazards System, implement chemical parks, drinking water sources, tailings ponds and other dangerous, heavy and toxic Environmental risk prevention and control measures for key areas, industries and fields of hazardous substances, and establish environmental safety A dynamic list of all hidden dangers, implement the main responsibility of environmental risk prevention, prevent and resolve major and serious emergencies The risk of ecological and environmental incidents will be raised. A list of key environmental risk enterprises will be established, and the oil and gas companies along the Yangtze River will be

Machine Translated by Google

Key enterprises such as chemical industry, nonferrous metallurgy, pesticide, pulp and paper making, etc. carry out emergency ecological environment incident response

Register and disclose information on risky enterprises, and urge enterprises to improve their environmental safety management systems

and environmental emergency facilities.

Strengthen environmental risk management and control of tailings ponds and slag dumps. Establish a classification system for tailings ponds

Focusing on the mining concentrated areas such as Panzhihua and Liangshan, we will carry out environmental

Risk and hidden danger investigation, focusing on promoting pollution treatment of historical slag, smelting slag and tailings ponds

Management and environmental risk control, and carry out targeted emergency drills for sudden ecological and environmental incidents.

Chengdu Plain and areas prone to geological disasters are the focus, with comprehensive damage degree, control difficulty

The degree and environmental risk level of industrial solid waste should be classified, graded and orderly promoted.

Improve the management of industrial solid waste and gradually eliminate the historical waste.

The tailings pond pollution control project was carried out with a focus on the Panxi area and the upper reaches of the Jialing River.

Pollution control, and orderly advance the investigation and remediation of historical mining pollution.

(2) Improve the emergency management system.

Improve environmental emergency management capabilities. Strengthen the company's emergency response to sudden ecological and environmental incidents.

Plan management, strengthen technical guidance, and implement the enterprise environmental safety hazard investigation and management system

The system urges enterprises to improve their enterprise registration according to their industries and strengthen their emergency drills.

Develop the environmental emergency plan database and promote emergency command and decision-making for sudden environmental incidents

Data platform construction. Promote the construction of environmental emergency training base and support the construction in Chengdu

National comprehensive environmental emergency training base. Promote the construction of national ecological environment emergency technical base.

Technical laboratory. Carry out pilot projects on emergency response technology methods for sudden ecological and environmental incidents,

Develop emergency response technologies for sudden water ecological environment events by exchanging space for time, and air pollution

Machine Translated by Google

The research work on the prediction technology of the diffusion pathway and range of the pollutant is also carried out.

Guide to emergency response techniques and methods.

Improve emergency reserve capacity. Improve the environmental emergency material reserve system and strengthen provincial-

Construction of environmental emergency material reserves at the city-county level.

Determine the scale and types of material reserves. Establish and improve the storage, replenishment, renewal and rotation of emergency materials.

Implement dynamic management of material reserve information and master commonly used

Urgently handle the information of material manufacturers and production capacity to form a continuous emergency supply capability.

Improve emergency response capabilities. Clarify environmental emergency management responsibilities and strengthen related functions

Strengthen joint prevention and control of river basin risks and carry out cross-regional environmental

Joint prevention and control of environmental risks and emergency response to sudden ecological and environmental incidents, explore ways to jointly build an environmental risk

Promote the construction of the Chengdu-Chongqing environmental emergency monitoring center

Improve the emergency monitoring support efficiency of the three levels of province, city and county

Environmental incident emergency monitoring and early warning capabilities, promote the integration of environmental emergency early warning platforms with existing water environment

Connect with network data platforms such as environmental and atmospheric environment to accelerate the application of environmental emergency warning informationization

Construction to ensure early detection, early dispatch and early disposal of environmental emergencies. Improve regional linkage

Environmental emergency monitoring system.

(3) Strengthen risk prevention and control of toxic and hazardous chemical substances.

Strengthen environmental supervision of hazardous chemicals. Optimize the layout of high-risk chemical enterprises and

Speed up the process of “withdrawing from the city and entering the park” and gradually withdraw from environmentally sensitive areas. Continue to carry out the province’s hazardous

Conduct environmental risk investigation in the field of chemicals. Carry out statistics on environmental information of existing chemical substances and strengthen

Registration of new chemical substances for environmental management, implementation of comprehensive management of hazardous wastes such as discarded hazardous chemicals

Machine Translated by Google

Life cycle information traceability control. Carry out key operations such as petrochemicals, chemicals, and hazardous waste disposal.

Comprehensive management of hazardous chemicals safety in the industry, and achieve environmental risk management of hazardous chemicals enterprises

Comprehensive assessment. Scientifically formulate a risk assessment plan for "priority controlled chemical substances".

Strengthen the management of new pollutants. Strengthen the environmental management registration of new chemical substances, strengthen

Supervision during and after the event, and implementation of environmental risk control measures.

Conduct environmental surveys, monitoring and environmental risk assessments of toxic and hazardous chemical substances in various fields.

Actively promote the elimination of new pollutants such as persistent organic pollutants, environmental hormones, and microplastics in the Yangtze River Economic Belt

Pollutant control. Increase the environmental risk control of new pollutants. Implement a number of persistent

Substitution and reduction projects for controlled chemical substances such as organic pollutants, and treatment of new pollutants

Engineering.

(4) Strengthen nuclear and radiation safety supervision.

Improve nuclear and radiation safety. Promote nuclear and radiation environmental safety supervision and monitoring

Continue to implement the online monitoring of high-risk mobile radioactive sources.

Coverage ensures the safety and control of radioactive isotopes and radiation devices.

Improve the level of information management, strengthen the application of big data analysis in nuclear and radiation environmental supervision and monitoring, and promote

Build an automated radiation environment monitoring network. Strengthen the monitoring of key electromagnetic facilities, equipment and associated radiation.

Radiation safety supervision and management in the utilization of radioactive mines.

Promote radioactive pollution control. Accelerate the decommissioning of urban radioactive waste repositories.

Final disposal of radioactive sources and radioactive waste, improving the safety level of urban radioactive waste storage

The safe storage rate of obsolete (retired) radioactive sources has reached 100% ÿ Conduct research reactor and nuclear

Supervisory monitoring of radiation safety in the environment outside fuel cycle facilities.

Machine Translated by Google

Column 7 Environmental Safety Engineering

(I) New pollutant control and environmental health risk projects In key river basins such as the Minjiang River, Tuojiang River, and the Yangtze River mainstream, environmental surveys, monitoring, and environmental risk assessments of toxic and hazardous chemicals such as endocrine disruptors, antibiotics, and perfluorinated compounds are carried out. Pilot work on regional ecological environment and health surveys and assessments is carried out in the Chengdu Plain. (II) Environmental risk prevention and early warning projects Build water quality online biological early warning systems in important water sources such as the Zipingpu Reservoir, Heilongtan Reservoir, Shengzhong Lake, and Bailong Lake. Build a number of water environment risk early warning platforms in key river basins such as the Minjiang River, Tuojiang River, and the Yangtze River mainstream. Build an ecological environment monitoring and early warning command center. Carry out risk early warning system construction for key parks involving chemical, petrochemical, nonferrous metals and other industries. Carry out risk investigation and remediation projects for industrial solid waste dumps and slag yards in cities such as Chengdu, Deyang, and Ya'an, as well as in the Longmenshan Fault Zone. Implement a comprehensive risk remediation project for tailings ponds in Panzhihua, Aba, Ganzi, Liangshan, and the upper reaches of the Jialing River. (III) Environmental Risk Emergency Response Capacity Building Project: Build a provincial environmental emergency material reserve center in Chengdu, and build provincial environmental emergency material reserve sub-depots in Ganzi and Aba, forming a "1+7+3" provincial material reserve layout. Build 21 municipal environmental emergency material reserve depots, and encourage regions with conditions to build county-level environmental emergency material reserve depots. Establish a provincial environmental emergency material information management system. Strengthen the construction of environmental emergency material reserves in Luzhou, Neijiang, Guang'an, Dazhou and other Sichuan-Chongqing border areas, as well as Mianyang, Guangyuan and other Sichuan-Gansu and Sichuan-Shaanxi border areas. Promote the construction of provincial environmental emergency training bases in the Chengdu Plain, Southern Sichuan, and Northeast Sichuan Economic Zone.

IX. Strengthen the protection and restoration of natural ecology and improve the quality and stability of the ecosystem

Adhere to the integrated protection and systematic management of mountains, rivers, forests, farmlands, lakes, grasslands and sand ice to build a solid ecological security Strengthen the protection and supervision of key ecological spaces, increase efforts to protect biodiversity, Maintain the authenticity and integrity of natural ecosystems and guard the natural ecological safety boundaries.

(1) Build an ecological security pattern.

Strengthen the management of key ecological function areas. Strengthen the forest and biodiversity functions in Sichuan and Yunnan Area, Ruoergai Grassland Wetland Ecological Function Area, Liangshan Soil and Water Conservation Ecological Function Area, Ecosystem conservation in four national key ecological function zones in the Qinba Biodiversity Ecological Function Zone protection and restoration, protecting important wildlife and plant resources, and improving the quality of life on the Yellow River such as Ruoergai and Shiqu.

Machine Translated by Google

Improve the water conservation capacity of tourist areas. Connect with the ecosystem service functions of national key ecological function areas

Optimize transfer payments to key ecological function areas

Fund use management, focus on supporting ecological product value preservation and appreciation, promote key ecological function areas

Improve the supply and transformation capacity of high-quality ecological products. Carry out the construction of Northwest Sichuan Ecological Demonstration Zone.

Set up level evaluation and assessment.

Strengthen the protection of nature reserves. Promote the development of nature reserves with national parks as the main body.

System construction, preparation of nature reserve planning, and further integration and optimization of nature reserves.

We will build the Giant Panda National Park and promote the establishment of the Zoige National Park.

Strengthen the protection and management of nature reserves and the construction of nature parks.

The land protection supervision system implements differentiated management and control, and strengthens the supervision of ecological environment violations in nature reserves.

Continue to carry out the “Green Shield” nature reserve strengthening supervision work

Carry out protection effectiveness evaluation of nature reserves. Strictly control the scope of nature reserves.

Human activities will be carried out to promote the orderly withdrawal of residents and cultivated land in the core protection areas.

Strengthen the supervision of ecological protection red lines. Carry out the demarcation and demarcation of ecological protection red lines,

Considering geographic boundaries, nature reserve boundaries, etc., the ecological protection red line is precisely implemented.

Formulate local regulations on ecological protection red lines according to local conditions. Improve the ecological protection red lines

Supervision system, strengthen the construction of Sichuan Province's ecological protection red line supervision informatization, and timely grasp the

The area, nature, function and management of ecological protection red lines in provinces, key areas and counties, and their impact on the environment

Strengthen daily supervision of human activities within the ecological red line and carry out

Evaluation of the effectiveness of ecological protection and restoration and changes in ecological functions.

(2) Strengthen the protection and restoration of important ecosystems.

Protect forest ecosystems. Fully implement the forest chief system, strengthen forest resource protection, and deepen

Machine Translated by Google

We will launch a national afforestation campaign to improve the function of forest ecosystems.

We will continue to implement key projects such as natural forest protection and restoration, returning farmland to forests, and public welfare forest protection.

Ecological engineering. Accurately improve forest quality, promote forest tending, degraded forest restoration, and cultivate

Multi-layer mixed forests of different ages. Improve the natural forest protection and restoration system and implement the natural forest management system.

Strengthen the construction of management and protection infrastructure. Strengthen the prevention and control of major forest pests such as pine wood nematode disease.

Improve forest fire prevention system through physical prevention and control.

Protect grassland ecosystems.

Focus on the ecological function of grasslands and carry out grassland ecological protection construction. Strictly protect the Yangtze River and the Yellow River

Natural grasslands, with Ganzi and Aba as key areas, are prohibited from being used in severely degraded and desertified grasslands.

Continue to promote the livestock reduction plan in plateau pastoral areas and the ecological protection and restoration of degraded grasslands.

Strengthen the prevention and control of grassland rodent and insect pests. Strictly implement the grass-livestock balance system, carry out desertification grassland and

Special treatment of black soil beach type degraded grassland. Implement basic grassland protection system, demarcate and protect

Protect basic grasslands and improve the reward and subsidy mechanism for grassland ecological protection.

Protect wetland ecosystems. Implement total wetland area control and scientifically determine wetland areas.

Control objectives, ensure the stability of the total amount of wetlands, and gradually increase the wetland protection rate.

The focus is on reducing the shrinkage and degradation of natural wetlands, expanding the wetland area, and improving the ecological service functions of wetlands.

Wetland protection and restoration projects were carried out in Ruoergai, Changsha Gongma and other wetland areas.

The project includes the construction of Qionghai Lake in Xichang, Guanyin Lake in Suining, Dongpo Lake in Meishan, and Yangtze River Wetland Park in Luzhou.

A number of pilot projects have been launched.

Expand wetland area.

Strengthen the restoration of degraded ecosystems. Deepen the work of controlling rocky desertification in karst areas.

The project will effectively increase forest and grass vegetation coverage, reduce soil erosion, and curb the spread of desertification.

Machine Translated by Google

Continue to promote the control of desertified land in northwest Sichuan and gradually restore vegetation on desertified land.

Soil loss control, carry out Jinsha River, Yalong River, Anning River, Dadu River, Min River, Bailong River, etc.

Pilot project for vegetation restoration in dry river valley areas and soil erosion and degradation areas in the lower reaches of the Jinsha River.

(3) Strengthen biodiversity protection.

Conduct biodiversity surveys and assessments.

The five priority areas for biodiversity conservation are the northern section, Qiangtang Three Rivers Source, Daba Mountains, and Wuling Mountains.

Carry out special surveys and assessments of key biological species. Strengthen the Yellow River Basin, Chishui River, Min River Basin,

Aquatic biological survey and observation in key river basins such as the Jinping Great Bend section of the Yangtze River, Jialing River, and Yalong River

Establish a Yangtze River (Sichuan section) aquatic biodiversity survey, evaluation and monitoring system

Improve the Yangtze River aquatic biological integrity evaluation index system and carry out

Investigation and evaluation of the integrity of the water ecosystem of key rivers in the Yangtze River Basin.

Long-term follow-up survey and evaluation of biodiversity along the road. Improve the biodiversity of Sichuan Province

Database, promote the construction of biodiversity conservation informatization. Formulate regional biodiversity

Conservation action plans and programming.

Implement adaptive protection of endangered wild animals and plants. Scientifically construct a mechanism to promote species migration and

Ecological corridors for gene exchange, rational layout and construction of species protection space system, and focus on strengthening

Strengthen the protection and management of rare and endangered animals and plants, flagship species and indicator species.

Protect and restore wildlife habitats and native habitats, and develop

Ex situ conservation of endangered species, giving priority to the implementation of key protected wild animals and plants and extremely small populations of wild animals and plants

Plant protection project. Promote the construction of natural protection areas for rare and endemic fish in the upper reaches of the Yangtze River.

Optimize the wildlife rescue network, improve the layout and build a number of wildlife rescue

Breeding centers, build artificial breeding centers for rare and endangered plants such as orchids. Strengthen wild

Machine Translated by Google

Supervise the use of animals, plants and their products, and strictly implement the decision to ban the consumption of terrestrial wild animals.

Strengthen the prevention and control of alien invasive species. Establish an alien species invasion risk index assessment system.

The system has set up monitoring stations for alien invasive species, such as Eupatorium adenophorum, Eichhornia crassipes, and Nelumbo nucifera.

Focus on the risk survey and assessment of alien species, such as grass and golden apple snails. Establish a prevention and control system

system, formulate emergency response plans for the prevention and control of alien invasive species disasters, and establish

The epidemic prevention and quarantine law enforcement linkage mechanism has been established in key areas such as the Chengdu metropolitan area, Panxi area, and the Yellow River Basin.

The region carries out prevention and control of alien invasive species to maintain regional biosecurity.

(4) Strengthen ecological protection supervision.

Continue to carry out ecological protection surveys and assessments. Establish an ecological protection assessment system, classify

Formulate indicator systems and technical methods. Carry out provincial ecological quality and status assessments and conduct regular

Release the Sichuan Province Ecological Quality Report to fully grasp the changes and trends in the province's ecological conditions.

Focusing on the Yellow River Basin in Sichuan and the upper reaches of the Minjiang River Basin, regional and river basin ecological assessments are carried out.

The Yangtze River and its main tributaries, as well as key lakes and reservoirs such as Qionghai Lake and Lugu Lake, are the targets of the project.

Remote sensing monitoring and assessment will be carried out. Ecological protection red lines will be used to delineate areas, nature reserves, and

The development of shale gas, large-scale hydropower development, Sichuan-Tibet Railway and other linear engineering areas are the focus of the project.

Regularly carry out annual assessment of key ecological function areas in counties

Evaluate.

Accelerate the improvement of ecological protection monitoring (observation) network.

Based on the network, we will coordinate and optimize the layout of ecological monitoring sites and promote a number of key areas and important

11. Deepen reform and innovation, and promote the modernization of environmental governance system and governance capacity

Comprehensively promote the reform and innovation of the ecological civilization system, establish a multi-party governance structure, and improve the environmental environmental economic policy system, enhance the construction of modern environmental governance capacity, and create ecological and environmental protection projects Become an iron army and provide strong support for the construction of beautiful Sichuan.

(1) Establish a multi-party co-governance structure.

Strengthen the leadership of the Party Committee and the leading responsibility of the government. Give full play to the role of the Ecological and Environmental Protection Committee to comprehensively solve major problems in ecological and environmental protection, strengthen comprehensive decision-making, and form Strictly implement the ecological environment protection responsibility list and extend the responsibility to the township Town (street). Implement the environmental protection target responsibility system and assessment and evaluation system, and make environmental protection The completion of the protection targets will be included in the assessment of all levels and departments. Assessment, in the assessment of county economic development, strengthen ecological civilization construction, ecological environment protection, etc. The weight of indicators in key ecological function areas is not assessed on regional GDP. Improve the environmental information disclosure mechanism. Revise and improve the evaluation of ecological civilization construction goals in Sichuan Province Assessment system.

Strengthen provincial ecological and environmental supervision to solve prominent ecological and environmental problems and improve Focus on improving ecological environment quality and promoting high-quality economic development, and consolidate the construction of ecological civilization and political responsibility for ecological and environmental protection, and promote the institutionalization and regularization of provincial ecological and environmental protection inspections. We will firmly oppose and severely punish “one-size-fits-all” practices. Strictly implement provincial-level supervision Inspection and assessment management requirements, implementation of the annual ecological environment protection supervision plan management, Prepare routine inspections, special inspections, and dispatched supervisors. Explore the supervision of relevant provincial departments and provincial The provincial-level ecological environment protection supervision was carried out in state-owned enterprises.

Machine Translated by Google

We should strictly implement the "list system + responsibility system + cancellation system" and carry out "look back" and "review" in due course.

The inspection results will be used as a guide for the leadership team and leaders of the inspected objects.

It is an important basis for comprehensive assessment, evaluation, rewards, punishments and appointments and removals of leading cadres.

Give full play to the role of enterprises in environmental governance. Strengthen the management of pollution discharge in accordance with the law and promote

Establish a fixed pollution source supervision system with the pollutant discharge permit system as the core, strengthen the supervision of enterprises

The main responsibility of environmental governance is to guide enterprises to establish and improve environmental management systems and strictly control pollution.

Listed in the list of key pollutant discharge units and pollutant discharge permits

Enterprises that are subject to key management should install and use automatic monitoring equipment in accordance with the law and ensure that the equipment is functioning properly.

The monitoring data shall be falsified and the disclosure system of corporate environmental information in accordance with the law shall be strictly implemented.

It is encouraged to adopt forms such as enterprise open days and the construction of educational experience venues to promote

Open environmental protection facilities.

Strengthen social co-construction and public participation. Improve the public participation system and disclose

Disclose all kinds of environmental information, expand the scope of disclosure, protect the public's right to know, maintain and support the public

Exercise the right to know, participate and supervise. Build a social action system with the participation of all people,

Comprehensive reporting, hearing, public opinion and public supervision systems, guide social organizations to conduct on-site visits

Participate in environmental supervision through interviews, public opinion surveys, photography and videography. Innovate and improve the ecological environment

Complaints and petitions work mechanism, improve the environmental protection complaint and reporting management platform function, and facilitate environmental protection supervision

Supervision channels, promote the comprehensive use of petition information. Implement the reward system for reporting environmental violations

Accelerate the cultivation and development of social organizations, guide environmental protection organizations to carry out public ecological and environmental protection activities in accordance with the law.

Explore the establishment of ecological and environmental protection public welfare small-sum grant projects.

In 2017, the environmental information disclosure rate reached 100%, and the public's satisfaction with ecological civilization construction was significantly

Machine Translated by Google

Significantly improved.

(2) Improve the environmental supervision system.

Promote the construction of ecological monitoring network. Based on modern sensing technology and big data technology,

Accelerate the construction of an ecological environment monitoring network that integrates heaven and earth, coordinates top and bottom, and shares information.

The monitoring of pollution sources, environmental quality and ecological conditions is fully covered, and the environmental quality early warning accuracy is improved.

Improve the province's ecological environment monitoring big data platform.

Facilities and equipment are insufficient, and an automatic monitoring network for atmospheric complex pollution in key areas is established to improve temperature

The monitoring capacity of indoor gas will be increased, and the scope of water environment monitoring will be further extended to the township level.

Improve the monitoring indicators of characteristic pollution such as organic matter and heavy metals.

Dynamic monitoring and surveillance system to enhance the early warning capability of water sources. Continue to promote the sound environment of functional areas

Automatic monitoring point construction. Strengthen the monitoring and supervision system of key development zones and key pollution sources.

Construction.

Comprehensively improve the rapid response capability of environmental monitoring. Complete groundwater and water ecological monitoring

Strengthen the research and development of monitoring technologies for characteristic pollutants and new pollutants in specific industries.

Development and application, increase the Southwest Regional Air Quality Early Warning and Forecast Center, soil sample circulation

Strengthen the early warning and forecasting, risk assessment and laboratory base of monitoring agencies stationed in cities (prefectures)

Basic capacity building, establish a number of special

Special monitoring laboratories. Strengthen the emergency and law enforcement monitoring equipment of county-level monitoring agencies, and improve

Improve the ability to monitor pollution sources and respond quickly to law enforcement. Promote the construction of environmental

Environmental monitoring rooms and emergency material warehouses.

County-level monitoring stations will undergo standardized construction or upgrades.

Integrated ecological environment governance market.

Column 10 Major projects to improve ecological environment governance capabilities

(I) Ecological environment intelligent monitoring capacity modernization construction project

Add or relocate atmospheric complex pollution monitoring stations. Carry out greenhouse gas and black carbon concentration monitoring in key cities. Select representative acoustic environment functional areas to build noise automatic monitoring station systems; select some major traffic arteries and provincial development zones in the province to build noise automatic monitoring stations. Build fixed motor vehicle exhaust remote sensing monitoring points on the main roads for diesel vehicles. Build a "water bloom" early warning perception network for key lakes and reservoirs, upgrade and transform existing national and provincial test section water quality automatic monitoring stations, and supplement the heavy metal and organic matter automatic monitoring capabilities of key river basin intersection sections. Build new water quality automatic stations in key river basins such as the Minjiang River, Tuojiang River, Jialing River and their tributaries. Install video surveillance systems at municipal centralized drinking water sources. Upgrade and transform water quality automatic monitoring stations at prefecture-level centralized drinking water sources in Chengdu, Neijiang, Guang'an, Dazhou, Ziyang and other places; build some county-level centralized drinking water sources. Deploy and carry out agricultural non-point source pollution monitoring and supervision in Chengdu, Zigong, Meishan, Ziyang and other places. Build an ecological environment comprehensive observation station in the Yellow River Basin. (II) Improve the monitoring capacity

of environmental laboratories. Build a number of key

laboratories such as the heavy metal analysis experimental sub-center, ecological biological monitoring laboratory, soil monitoring special laboratory, environmental health key laboratory, and groundwater monitoring special laboratory. According to the national secondary station standards, renovate the existing laboratories of the city-based monitoring stations in Chengdu, Guangyuan, Yibin, Ya'an, etc., and build new station buildings for the city-based monitoring stations in Luzhou, Suining, Leshan, etc. Upgrade and renovate the laboratories of some key county-level monitoring stations. (III) Modernization of ecological

environment law enforcement and supervision capacity construction project Build a city

(prefecture) ecological environment protection law enforcement and judicial linkage center, set up an ecological environment dispute mediation center in counties (cities, districts) with large populations, developed economies, and heavy environmental supervision tasks, and promote the construction of ecological environment supervision and law enforcement agencies in townships (streets) across the province in a classified manner. Add new atmospheric analysis and quality control equipment and mobile pollution source detection and traceability online equipment. Equip Deyang, Mianyang, Neijiang, Nanchong, Dazhou, Meishan and other cities (prefectures) with VOCs cruise monitoring vehicles and portable

VOCs monitors (LDARs). (IV) Ecological and environmental scientific

research and innovation capacity building project Implement the Chengdu ecological and environmental "digital environment" project. Actively promote the construction of Tianfu Laboratory, Chengdu Innovation Institute of the Chinese Academy of Environmental Sciences, and the Chengdu Plain Air Complex Pollution Research and Prevention Academician Workstation. Support the construction of municipal (prefectural) ecological and environmental comprehensive research institutions.

12. Safeguard Measures

Adhere to Xi Jinping's thoughts on ecological civilization to arm the mind, guide practice, and promote work, Strengthen the main responsibility, form a working synergy, and ensure the completion of the province's "14th Five-Year Plan" ecological environment Protect various objectives and tasks.

(1) Clarify the division of tasks.

Strengthen the organizational leadership of plan implementation and establish a provincial-level departmental division to promote plan implementation. The government at all levels should establish a collaborative mechanism to strengthen guidance, coordination and supervision to ensure the smooth implementation of the plan. The government shall be responsible for the ecological environment quality in its jurisdiction and shall and major tasks, formulate and implement the “Ten Major Tasks” for ecological and environmental protection in the region in light of local conditions. The Fourth Five-Year Plan decomposes and implements planning goals and tasks, establishes responsibility for ecological environmental protection goals Responsibility system, ensure that responsibilities, measures and investment are in place to ensure the smooth progress of planning goals accomplish.

(2) Increase investment.

According to the division of fiscal powers and expenditure responsibilities, funds for ecological environmental protection should be included in the same Governments at all levels should make ecological environment a key area of fiscal expenditure. The investment in ecological environment funds shall be regarded as basic and strategic investment and given priority protection. To coordinate the relationship between fiscal funds allocation and planning implementation, and ensure the coordination between fiscal budget funds and planning Improve the accuracy and efficiency of fiscal fund allocation and optimize First, invest in major tasks and key projects determined in the plan. The role of the market is to allocate funds through market-oriented means and follow the model of “sharing benefits and sharing risks”. To encourage and guide social capital to increase investment.

(3) Strengthen public participation.

Machine Translated by Google

Make full use of various media such as newspapers, television, the Internet, social platforms and digital media, Increase publicity efforts for the plan and regularly publish information on environmental quality, project construction, and capital investment. and other planning implementation information to ensure that the implementation of the plan is disclosed in a timely manner. The supervisory role of news media and other social forces, strengthening the role of environmental protection volunteers, and establishing planning Implement public feedback and supervision mechanisms.

(IV) Strict evaluation and assessment.

Implement the annual planning scheduling mechanism and improve the assessment and evaluation mechanism for the implementation of the plan. The planning objectives and main tasks are included in the performance evaluation of relevant departments (units) in all regions. In 2023 and 2026, a mid-term evaluation and final review of the implementation of the plan will be conducted. Assessment.
